Abstract

We make a detailed analysis on validity of gauge-fixing conditions and the structure of propagators in the Wess-Zumino-Witten-type open superstring field theory. First, we generalize the gauge-fixing conditions considered in JHEP **03** (2012) 030 [arXiv:1201.1761] by the present author et al., and propose a large class of conditions characterized by zero modes of world-sheet oscillators. Then we demonstrate its validity: we prove that gauge degrees of freedom allow us to impose the conditions, and that the conditions fix the gauges completely. Moreover, we elucidate how the information about the gauge choices is reflected in the structure of propagators. The results can be readily extended to the case in which gauge-fixing conditions involve linear combinations of the world-sheet oscillators, including nonzero modes. We investigate also such extended gauges, which are the counterpart of linear b-gauges in bosonic string field theory, and obtain the corresponding propagators.

1 Introduction

The open-closed duality is one of the most fundamental properties of string theory. In the perturbative description, closed strings naturally appear in loop diagrams of open strings. However, in the framework of open string *field* theory, it is enigmatic how closed strings are encoded in the form of open string fields. In fact, we have not yet known even the answer to the question whether or not closed strings can be described in terms of *fields* of open strings.

One natural approach to gaining a key to this question will be to quantize the field theory. From the viewpoint of the open-closed duality, the quantum effect of open strings inevitably involves closed strings. Hence, the point of the matter is whether or not open string field theory is consistently quantized without additional dynamical degrees of freedom, such as closed string fields. A criterion for the judgment is provided by the Batalin-Vilkovisky (BV) formalism [1].[1] According to this formalism, consistent path-integral quantization of a gauge system is possible only when a certain fundamental equation has a solution. The equation, which is called the quantum master equation, is an extension of the Ward-Takahashi identity, and the existence of its solution ensures gauge independence of the partition function. Moreover, it is known that violation of the quantum master equation corresponds to a gauge anomaly [3]. Therefore, we expect that the equation will play the role of the touchstone: if open string field theory lacks some needed information about closed strings, then its gauge symmetry would be anomalous, and the quantum master equation could not be satisfied.

In bosonic string field theory [4], an attempt was made by Thorn [5] to construct the solution to the quantum master equation, but there was a difficulty of divergences from tadpole diagrams.[2] Furthermore, aside from this problem, the theory has another intrinsic difficulty due to the existence of the tachyon: quantization can be considered only in a formal manner. By contrast, in superstring field theory, we expect that these difficulties will be absent. Recently, analytic methods in classical bosonic string field theory, which developed mainly after Schnabl's analysis [7] of the tachyon vacuum, have been applied to superstring field theory. Moreover, the work [8] by Kiermaier and Zwiebach opened up a vista for extending the methods at least to the one-loop level. It seems that we are now at the stage for exploring earnestly the quantization of open superstring field theory.

The first covariant open superstring field theory was constructed by Witten [9]. It was a natural extension of the cubic bosonic string field theory [4], with the action composed of the string fields in the natural picture: a Neveu-Schwarz (NS) string field of picture number minus one and a Ramond string field of picture number minus a half. However, it was pointed out by Wendt [10] that the theory suffered divergences caused by the picture-changing operator [11, 12] inserted at the string midpoint. To remedy this, various superstring field theories have been proposed. In one approach, the problem is circumvented within the framework of cubic superstring field theory, at the cost of the naturalness of the picture [13, 14]. This modified version of Witten's theory, as well as Witten's original one, is formulated in the small Hilbert space and still needs picture-changing operators. By contrast, in another approach investigated in refs. [15, 16, 17], two types of theory are constructed without using any picture-changing operators in virtue of the large Hilbert space formulation, although the resultant actions are non-polynomial.

---

[1] See ref. [2] for a pedagogical review.

[2] For detailed analysis of the tadpole diagrams, see ref. [6].

In the sequence of papers [18, 19], the present author et al. have dealt with superstring field theory of the latter approach.[3] As a first step toward quantization, we have considered gauge fixing, concentrating on the NS-sector action [15], which is of the Wess-Zumino-Witten (WZW) type. In particular, the first paper [18] is devoted to the analysis of the free theory. There, we have gauge-fixed the free theory completely, and have found that it requires infinitely many ghost string fields $\Phi_{(-n,m)}$ $(1 \leq n,\ 0 \leq m \leq n)$ and antighost string fields $\Phi_{(n+2,-m)}$ $(1 \leq m \leq n+1)$, as well as the original string field $\Phi_{(0,0)}$, with a subscript (g,p) on a string field indicating its world-sheet ghost number g and picture number p. Furthermore, we have also calculated propagators, including those in the ghost string field sector. However, validity of the gauges is not proved in the paper, nor is it transparent how the information about the gauge choices is incorporated into the propagators. The main purpose of the present paper is to solve these problems in a manner such that the underlying structure is manifest. We also aim at generalizing the results in ref. [18].

Let us now give the outline of the present paper. First, generalizing the gauge-fixing conditions considered in ref. [18], we propose a larger class of conditions of the form

$$\boldsymbol{B}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi}_{\boldsymbol{-n}} = 0\,, \quad \widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi}_{\boldsymbol{n+2}} = 0 \qquad (\forall n \geq 0)\,. \tag{1.1}$$

Here

$$\boldsymbol{\Phi}_{\boldsymbol{-n}} := \begin{bmatrix} \Phi_{(-n,0)} \\ \Phi_{(-n,1)} \\ \vdots \\ \Phi_{(-n,n)} \end{bmatrix}, \quad \boldsymbol{\Phi}_{\boldsymbol{n+2}} := \begin{bmatrix} \Phi_{(n+2,-1)} \\ \Phi_{(n+2,-2)} \\ \vdots \\ \Phi_{(n+2,-(n+1))} \end{bmatrix} \qquad (n \geq 0) \tag{1.2}$$

are $(n+1)$-component vectors composed of string fields, whereas $\boldsymbol{B}_{\boldsymbol{n+2,n+1}}$ and $\widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}$ are $(n+2)\times(n+1)$ matrices characterized by zero modes of world-sheet oscillators.[4]

Second, we demonstrate the validity of the above gauge-fixing conditions. The proof involves two steps: one has to show reachability and completeness of the conditions.

1. **(Reachability)** By using the gauge degrees of freedom, one can let string fields reach the configuration where the conditions hold.

2. **(Completeness)** If once the conditions are imposed, there remains no residual gauge symmetry that preserves the conditions. In other words, the conditions eliminate the gauge degrees of freedom completely.

---

[3] See also refs. [20, 21, 22]. While the authors were writing their papers, a work on the former approach appeared [23].

[4] For simplicity, we have omitted here some indices on the gauge-fixing matrices $\boldsymbol{B}$ and $\widetilde{\boldsymbol{B}}$ in eq. (3.1).

Third, with the aid of the byproducts of the proof, we elucidate how the gauge-fixing conditions are reflected in the structure of the propagators. The result is similar to that obtained in refs. [24, 25] in the case of the bosonic string field theory [4]. To be specific, suppose that we impose linear b-gauge conditions [24] on bosonic string fields:

$$\mathcal{B}_{(g)}\Psi_g = 0 \quad (\forall g \in \mathbb{Z})\,. \tag{1.3}$$

Here Ψ_g is a bosonic string field of world-sheet ghost number g, and $\mathcal{B}_{(g)}$ is a linear combination of b-ghost oscillators.[5] The subscript (g) indicates that $\mathcal{B}_{(g)}$ acts upon Ψ_g. Under the conditions (1.3), the ghost propagator Δ_g between Ψ_g and Ψ_{2-g} $(g \leq 0)$ is given by

$$\Delta_g = \frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\, Q\, \frac{\mathcal{B}_{(g+1)}}{\mathcal{L}_{(g+1)}} \quad \text{with} \quad \mathcal{L}_{(g)} := \{Q, \mathcal{B}_{(g)}\}\,, \tag{1.4}$$

where Q denotes the Becchi-Rouet-Stora-Tyutin (BRST) operator in the first-quantized theory. We obtain a similar expression in the supersymmetric case. In the WZW-type superstring field theory, the ghost propagator $\boldsymbol{\Delta_{n+1,n}}$ between $\boldsymbol{\Phi_{-n}}$ and $\boldsymbol{\Phi_{n+1}}$ $(n \geq 1)$ essentially takes the form

$$\boldsymbol{\Delta_{n+1,n}} = \big(\boldsymbol{P_{n+1,n+1}}\,\boldsymbol{B_{n+1,n}}\big)\,\boldsymbol{Q_{n,n+1}}\,\big(\boldsymbol{P'_{n+1,n+1}}\,\boldsymbol{B'_{n+1,n}}\big), \tag{1.5}$$

where all the symbols $\boldsymbol{P}$, $\boldsymbol{B}$, $\boldsymbol{Q}$, $\boldsymbol{P'}$, and $\boldsymbol{B'}$ represent matrices, whose sizes are indicated by their subscripts (and thus $\boldsymbol{\Delta_{n+1,n}}$ is an $(n+1)\times n$ matrix). In particular, $\boldsymbol{Q}$ is an extension of the BRST operator Q. The matrices $\boldsymbol{P}$ and $\boldsymbol{P'}$ are the counterparts of $1/\mathcal{L}_{(g)}$ and $1/\mathcal{L}_{(g+1)}$ in eq. (1.4), and $\boldsymbol{B}$ and $\boldsymbol{B'}$ are precisely the gauge-fixing matrices.

It should be noted that the conditions (1.1) are analogous to the Siegel gauge condition [26] in that they consist of zero modes of world-sheet oscillators. In order to develop our analysis further, lastly, we also consider the extension similar to linear b-gauges [24]. We investigate those conditions which involve linear combinations of the world-sheet oscillators, including nonzero modes, and find the corresponding propagators.

The present paper is organized as follows. In the next section, we review gauge fixing of the free superstring field theory, and explain how one can obtain BRST-invariant actions under general gauge-fixing conditions. We shall see that gauge-fixing matrices have to satisfy certain constraints in order for the gauges to be compatible with the BRST transformations. After that, in section 3, we propose a class of gauge-fixing conditions which meet the compatibility constraints, and prove its validity in section 4 (and in appendix C). In the process of showing the completeness of the gauges, we discover the key ingredients of propagators. They play an essential role when we derive the propagators in section 5. Extending these results further, in section 6, we are going to consider a simple counterpart of linear b-gauges. Finally, section 7 is allocated for a summary and a discussion. Several appendices are provided to supply details and to help one's understanding.

---

[5] Strictly, in order to provide physically reasonable gauges, $\mathcal{B}$'s have to satisfy some constraints.

2 The free action and its gauge fixing

The free action in the WZW-type open superstring field theory [15] takes the form[6]

$$S_0 = -\frac{\mathrm{i}}{2} \langle \Phi_{(0,0)}, Q\eta_0 \Phi_{(0,0)} \rangle \ , \tag{2.1}$$

where $\Phi_{(0,0)}$ is a Grassmann-even NS-sector string field of even parity under the Gliozzi-Scherk-Olive (GSO) projection. Here and in the sequel, unless otherwise stated, a subscript (g,p) on a string field indicates its world-sheet ghost number g and picture number p. In particular, $\Phi_{(0,0)}$ carries no world-sheet ghost number and no picture number. The symbol Q denotes the BRST operator in the first-quantized theory, and η_0 denotes the zero mode of η, which appears in the bosonization [11, 12] of the superconformal ghosts: $\beta = \mathrm{e}^{-\phi}\partial\xi,\ \gamma = \eta \mathrm{e}^{\phi}$. We adopt the convention in which the quantum number (g,p) of Q, of η, and of ξ are $(1,0)$, $(1,-1)$, and $(-1,1)$, respectively.[7] Both Q and η_0 act as the derivation upon string fields, satisfying

$$Q^2 = \eta_0^2 = \{Q, \eta_0\} = 0\,. \tag{2.2}$$

In eq. (2.1), we have denoted by $\langle\ ,\ \rangle$ the Belavin-Polyakov-Zamolodchikov (BPZ) inner product [27]. Because the theory is formulated in the large Hilbert space, we need the insertion of ξ, of $c\partial c\partial^2 c$, and of $\mathrm{e}^{-2\phi}$ to obtain nonzero correlators. Owing to this anomaly, inner products of the form $\langle \Phi_{(g_1,p_1)}, \Phi_{(g_2,p_2)} \rangle$ vanish unless $(g_1+g_2, p_1+p_2) = (2,-1)$.

The above action is invariant under the gauge transformation parameterized by the Grassmann-odd string fields $\Lambda_{(-1,0)}$ and $\Lambda_{(-1,1)}$:

$$\delta\Phi_{(0,0)} = Q\Lambda_{(-1,0)} + \eta_0 \Lambda_{(-1,1)}\,. \tag{2.3}$$

In ref. [18], we have fixed the gauge completely, and have shown that it requires infinitely many ghost string fields and antighost string fields of various (g,p)'s. In the present section, we are going to review the result by the use of the BRST formalism, in a manner which helps us to deal with a larger class of gauge-fixing conditions.

Throughout the present paper, we use the following notation. Let U and V be vectors composed of string fields:

$$U = \begin{bmatrix} u_1 \\ \vdots \\ u_m \end{bmatrix}, \quad V = \begin{bmatrix} v_1 \\ \vdots \\ v_m \end{bmatrix} \qquad (u_i \text{ and } v_i\ (1 \le i \le m) \text{ are string fields}).$$

We define the inner product $\langle U, V\rangle$ as

$$\langle U, V \rangle := \sum_{i=1}^{m} \langle u_i, v_i \rangle\,. \tag{2.4}$$

---

[6] In our convention, the operator $Q\eta_0$ is anti-Hermitian, so that a factor of the imaginary unit is needed in order for the action to be real (see appendix B).

[7] We list (g,p)'s of relevant operators in appendix A. The $\mathrm{SL}(2,\mathbb{R})$-invariant vacuum $|0\rangle$ is of $(g,p) = (0,0)$.

Furthermore, we define BPZ conjugation of a matrix whose components are operators: the BPZ conjugate $\mathrm{bpz}(\boldsymbol{M}) = \Big(\big(\mathrm{bpz}(\boldsymbol{M})\big)_{ij} \Big)$ of a matrix $\boldsymbol{M} = (M_{ij})$ is defined as

$$\big(\mathrm{bpz}(\boldsymbol{M})\big)_{ij} := \mathrm{bpz}(M_{ji})\,. \tag{2.5}$$

The $(i,\, j)$-component of $\mathrm{bpz}(\boldsymbol{M})$ is the BPZ conjugate of the $(j,\, i)$-component of $\boldsymbol{M}$. In other words, BPZ conjugation of a matrix is a combination of the conjugation of its components and transposition of the matrix. For example, we have[8]

$$\mathrm{bpz}\big(\begin{bmatrix} Q & \eta_0 \end{bmatrix}\big) = - \begin{bmatrix} Q \\ \eta_0 \end{bmatrix}, \quad \mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix}\right) = \begin{bmatrix} b_0 & \xi_0 \end{bmatrix}. \tag{2.6}$$

The definition (2.5) is quite natural. To see this, let V, W, $\boldsymbol{M_{l,m}}$, and $\boldsymbol{N_{m,n}}$ be an m-vector, an n-vector, an $l \times m$ matrix, and an $m \times n$ matrix, respectively. If all the components of V, $\boldsymbol{M_{l,m}}$, and $\boldsymbol{N_{m,n}}$ have the same Grassmann parities $\epsilon(V)$, $\epsilon(\boldsymbol{M})$, and $\epsilon(\boldsymbol{N})$, respectively, then the following equations hold:

$$\langle V,\, \boldsymbol{N_{m,n}} W \rangle = (-1)^{\epsilon(V)\,\epsilon(\boldsymbol{N})} \langle \mathrm{bpz}(\boldsymbol{N_{m,n}})\, V,\, W \rangle\,, \tag{2.7a}$$

$$\mathrm{bpz}(\boldsymbol{M_{l,m}} \boldsymbol{N_{m,n}}) = (-1)^{\epsilon(\boldsymbol{M})\,\epsilon(\boldsymbol{N})} \mathrm{bpz}(\boldsymbol{N_{m,n}})\, \mathrm{bpz}(\boldsymbol{M_{l,m}})\,. \tag{2.7b}$$

These are the natural extensions of the properties of the ordinary BPZ inner product and BPZ conjugation, for which $l = m = n = 1$. Note that the sizes of the matrices $\mathrm{bpz}(\boldsymbol{M_{l,m}})$, $\mathrm{bpz}(\boldsymbol{N_{m,n}})$, and $\mathrm{bpz}(\boldsymbol{M_{l,m}} \boldsymbol{N_{m,n}})$ are $m \times l$, $n \times m$, and $n \times l$, respectively.

2.1 Gauge fixing with the BRST formalism

Let us perform gauge fixing by the use of the BRST formalism. All the string fields to appear in what follows have even parity under the GSO projection. Because the Grassmann parity of a GSO-even basis state of the NS sector is congruent to its world-sheet ghost number, modulo two, we have

$$\epsilon\big(\Phi_{(g,p)}\big) \;\equiv\; g + \text{“Grassmann parity of the component fields of } \Phi_{(g,p)}\text{”} \quad (\mathrm{mod}\ 2). \tag{2.8}$$

Here $\epsilon\big(\Phi_{(g,p)}\big)$ denotes the Grassmann parity of a GSO-even string field $\Phi_{(g,p)}$. From eq. (2.8) it follows that the component fields of $\Phi_{(0,0)}$ are Grassmann even, as is expected.

Validity of the gauge-fixing conditions used below will be shown in section 4 (and in appendix C).

(I) Step 1: Gauge fixing of $\boldsymbol{S_0}$

To eliminate the gauge symmetry (2.3) of the action (2.1), we impose on $\Phi_{(0,0)}$ the condition

$$\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \Phi_{(0,0)} = 0\,. \tag{2.9}$$

---

[8] For the BPZ conjugation of an operator, see eqs. (A.4) and (A.6). The operators Q and η_0 are BPZ odd, whereas b_0 and ξ_0 are BPZ even.

This can be achieved by introducing the gauge-fixing term

$$S_1^{\mathrm{GF}} = -\left\langle \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \Phi_{(0,0)} \right\rangle = \left\langle \operatorname{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \Phi_{(0,0)} \right\rangle, \tag{2.10}$$

where $N_{(3,-1)}$ and $N_{(3,-2)}$ are auxiliary fields which obey a constraint to be mentioned. Because the component fields of $\Phi_{(0,0)}$ are Grassmann even, those of $N_{(3,-1)}$ and $N_{(3,-2)}$, also, have to be Grassmann even, in order that they may act as Lagrange multipliers for condition (2.9). Thus $N_{(3,-1)}$ and $N_{(3,-2)}$ are Grassmann odd (recall eq. (2.8)).

One obtains the (spacetime) BRST transformation of $\Phi_{(0,0)}$ merely by replacing the gauge parameters with corresponding ghost string fields:

$$\delta_B \Phi_{(0,0)} = \begin{bmatrix} Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix}. \tag{2.11}$$

Because the parameters $\Lambda_{(-1,0)}$ and $\Lambda_{(-1,1)}$ are Grassmann odd, the ghosts $\Phi_{(-1,0)}$ and $\Phi_{(-1,1)}$ are Grassmann even. Nilpotency of the BRST transformation sets the following constraint on the ghosts:

$$0 = \delta_B \left(\delta_B \Phi_{(0,0)} \right) = -\begin{bmatrix} Q & \eta_0 \end{bmatrix} \left(\delta_B \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right). \tag{2.12}$$

The BRST transformation of $\Phi_{(-1,0)}$ and $\Phi_{(-1,1)}$ will be determined later, consistently with this constraint.

The BRST-exact term below produces not only the gauge-fixing term S_1^{GF} but also the Faddeev-Popov (FP) term S_1^{FP}:[9]

$$S_1 = \delta_B \langle \Phi_{(2,-1)}, \Phi_{(0,0)} \rangle = \underbrace{\left\langle \operatorname{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \Phi_{(0,0)} \right\rangle}_{S_1^{\mathrm{GF}}} \underbrace{- \left\langle \Phi_{(2,-1)}, \begin{bmatrix} Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle}_{S_1^{\mathrm{FP}}}, \tag{2.13}$$

where $\Phi_{(2,-1)}$ is an antighost string field, whose Grassmann parity is odd. We have defined the BRST transformation of $\Phi_{(2,-1)}$, and of $N_{(3,-1)}$ and $N_{(3,-2)}$ as

$$\delta_B \Phi_{(2,-1)} = \operatorname{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = \begin{bmatrix} b_0 & \xi_0 \end{bmatrix} \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \qquad \delta_B \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = 0\,. \tag{2.14}$$

The form of S_1^{FP} requires that we impose

$$b_0 \xi_0 \Phi_{(2,-1)} = 0\,; \tag{2.15}$$

otherwise, there remains redundant symmetry of the form[10]

$$\Phi_{(2,-1)} \longrightarrow \Phi_{(2,-1)} + Q\eta_0 \Lambda_{(0,0)}\,. \tag{2.16}$$

---

[9] In the present paper, we use the convention in which FP terms have negative signs. This is different from the convention in ref. [18], in which FP terms have positive signs.

[10] As we shall see in section 2.2, this is part of the symmetry of the “extended action” (2.51).

Note that condition (2.15) is compatible with the BRST transformation (2.14):

$$b_0\xi_0\,\delta_B\Phi_{(2,-1)} = 0 \qquad \left(\because \quad b_0\xi_0\,\mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix}\right) = 0\right). \tag{2.17}$$

Eq. (2.17) ensures that the BRST transform of $\Phi_{(2,-1)}$ stays in the space where condition (2.15) holds. Furthermore, because $N_{(3,-1)}$ and $N_{(3,-2)}$ appear in the form

$$\mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix}\right)\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = \begin{bmatrix} b_0 & \xi_0 \end{bmatrix}\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix},$$

we have to restrict also the space of $N_{(3,-1)}$ and $N_{(3,-2)}$ to remove redundancy of the form

$$\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} \longrightarrow \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} + \mathrm{bpz}\left(\begin{bmatrix} b_0 & 0 \\ \xi_0 & b_0 \\ 0 & \xi_0 \end{bmatrix}\right)\begin{bmatrix} * \\ * \\ * \end{bmatrix} = \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} + \begin{bmatrix} b_0 & \xi_0 & 0 \\ 0 & b_0 & \xi_0 \end{bmatrix}\begin{bmatrix} * \\ * \\ * \end{bmatrix}. \tag{2.18}$$

For example, we may adopt the following condition:

$$\begin{bmatrix} c_0 & 0 \\ \eta_0 & c_0 \\ 0 & \eta_0 \end{bmatrix}\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = 0\,. \tag{2.19}$$

Here and in the sequel, gauge-fixing conditions on the original field $\Phi_{(0,0)}$ and ghosts are realized indirectly through gauge-fixing terms, whereas constraints on antighosts and auxiliary fields are imposed directly. In summary, we have finished eliminating the original gauge symmetry (2.3) by introducing the string fields listed below.

- The Grassmann-even ghost string fields $\Phi_{(-1,0)}$ and $\Phi_{(-1,1)}$ with

$$\delta_B\Phi_{(0,0)} = \begin{bmatrix} Q & \eta_0 \end{bmatrix}\begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix}. \tag{2.20}$$

- The Grassmann-odd antighost string field $\Phi_{(2,-1)}$ with

$$b_0\xi_0\Phi_{(2,-1)} = 0\,, \quad \delta_B\Phi_{(2,-1)} = \mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix}\right)\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}. \tag{2.21}$$

- The Grassmann-odd auxiliary string fields $N_{(3,-1)}$ and $N_{(3,-2)}$ with

$$\begin{bmatrix} c_0 & 0 \\ \eta_0 & c_0 \\ 0 & \eta_0 \end{bmatrix}\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = 0\,, \quad \delta_B\begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix} = 0\,. \tag{2.22}$$

The resultant action at this step is $S_0 + S_1$ with

$$S_0 = -\frac{\mathrm{i}}{2}\,\langle\Phi_{(0,0)}, Q\eta_0\,\Phi_{(0,0)}\rangle\,, \tag{2.23a}$$

$$S_1 = \underbrace{-\left\langle \Phi_{(2,-1)}, \begin{bmatrix} Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle}_{S_1^{\mathrm{FP}}} + \underbrace{\left\langle \mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \Phi_{(0,0)} \right\rangle}_{S_1^{\mathrm{GF}}} . \tag{2.23b}$$

(II) Step 2: Gauge fixing of $S_0 + S_1$

The action $S_0 + S_1$ is invariant under the gauge transformation of the ghosts:

$$\begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \longrightarrow \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} + \begin{bmatrix} Q & \eta_0 & 0 \\ 0 & Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Lambda_{(-2,0)} \\ \Lambda_{(-2,1)} \\ \Lambda_{(-2,2)} \end{bmatrix} . \tag{2.24}$$

We can remove this symmetry by imposing the condition

$$\begin{bmatrix} b_0 & 0 \\ \xi_0 & b_0 \\ 0 & \xi_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} = 0 . \tag{2.25}$$

The BRST transformation of the ghosts, which originates from the symmetry (2.24), is defined as

$$\delta_B \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} = \begin{bmatrix} Q & \eta_0 & 0 \\ 0 & Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-2,0)} \\ \Phi_{(-2,1)} \\ \Phi_{(-2,2)} \end{bmatrix} , \tag{2.26}$$

where $\Phi_{(-2,m)}$ $(0 \le m \le 2)$ are Grassmann-even ghosts for ghosts. We would like to remark that the above transformation is consistent with condition (2.12). Nilpotency of the BRST transformation at this step requires that $\Phi_{(-2,m)}$ be subject to the constraint

$$0 = \delta_B \left(\delta_B \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right) = - \begin{bmatrix} Q & \eta_0 & 0 \\ 0 & Q & \eta_0 \end{bmatrix} \left(\delta_B \begin{bmatrix} \Phi_{(-2,0)} \\ \Phi_{(-2,1)} \\ \Phi_{(-2,2)} \end{bmatrix} \right) . \tag{2.27}$$

The sum of the gauge-fixing term and the FP term is

$$\begin{aligned} S_2 &= \delta_B \left\langle \begin{bmatrix} \Phi_{(3,-1)} \\ \Phi_{(3,-2)} \end{bmatrix}, \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle \\ &= \underbrace{\left\langle \mathrm{bpz}\left(\begin{bmatrix} b_0 & 0 \\ \xi_0 & b_0 \\ 0 & \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(4,-1)} \\ N_{(4,-2)} \\ N_{(4,-3)} \end{bmatrix}, \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle}_{S_2^{\mathrm{GF}}} \underbrace{- \left\langle \begin{bmatrix} \Phi_{(3,-1)} \\ \Phi_{(3,-2)} \end{bmatrix}, \begin{bmatrix} Q & \eta_0 & 0 \\ 0 & Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-2,0)} \\ \Phi_{(-2,1)} \\ \Phi_{(-2,2)} \end{bmatrix} \right\rangle}_{S_2^{\mathrm{FP}}} . \end{aligned} \tag{2.28}$$

Here $\Phi_{(3,-m)}$ $(m = 1, 2)$ and $N_{(4,-m)}$ $(m = 1, 2, 3)$, both of which are Grassmann odd, are antighosts and auxiliary fields, respectively. We have defined their BRST transformations as

$$\delta_B \begin{bmatrix} \Phi_{(3,-1)} \\ \Phi_{(3,-2)} \end{bmatrix} = \mathrm{bpz}\left(\begin{bmatrix} b_0 & 0 \\ \xi_0 & b_0 \\ 0 & \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(4,-1)} \\ N_{(4,-2)} \\ N_{(4,-3)} \end{bmatrix} , \quad \delta_B \begin{bmatrix} N_{(4,-1)} \\ N_{(4,-2)} \\ N_{(4,-3)} \end{bmatrix} = 0 . \tag{2.29}$$

To get rid of the redundant symmetries[11]

$$\begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} \longrightarrow \begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} + \begin{bmatrix}Q\\ \eta_0\end{bmatrix} \Lambda_{(2,-1)}\,, \tag{2.30}$$

$$\begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix} \longrightarrow \begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix} + \mathrm{bpz}\left(\begin{bmatrix}b_0 & 0 & 0\\ \xi_0 & b_0 & 0\\ 0 & \xi_0 & b_0\\ 0 & 0 & \xi_0\end{bmatrix}\right)\begin{bmatrix}*\\ *\\ *\\ *\end{bmatrix}, \tag{2.31}$$

we impose the following constraints directly:

$$\begin{bmatrix}b_0 & \xi_0\end{bmatrix}\begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} = 0\,, \qquad \begin{bmatrix}c_0 & 0 & 0\\ \eta_0 & c_0 & 0\\ 0 & \eta_0 & c_0\\ 0 & 0 & \eta_0\end{bmatrix}\begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix} = 0\,. \tag{2.32}$$

The constraint on $\Phi_{(3,-m)}$ is compatible with the BRST transformation (2.29):

$$\begin{bmatrix}b_0 & \xi_0\end{bmatrix}\delta_B\begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} = 0 \qquad \left(\because \quad \begin{bmatrix}b_0 & \xi_0\end{bmatrix}\mathrm{bpz}\left(\begin{bmatrix}b_0 & 0\\ \xi_0 & b_0\\ 0 & \xi_0\end{bmatrix}\right) = 0\right). \tag{2.33}$$

To sum up, the gauge symmetry of $S_0 + S_1$ has been eliminated by introducing the following string fields.

- The Grassmann-even ghost string fields $\Phi_{(-2,m)}$ $(0 \le m \le 2)$ with

$$\delta_B\begin{bmatrix}\Phi_{(-1,0)}\\ \Phi_{(-1,1)}\end{bmatrix} = \begin{bmatrix}Q & \eta_0 & 0\\ 0 & Q & \eta_0\end{bmatrix}\begin{bmatrix}\Phi_{(-2,0)}\\ \Phi_{(-2,1)}\\ \Phi_{(-2,2)}\end{bmatrix}. \tag{2.34}$$

- The Grassmann-odd antighost string fields $\Phi_{(3,-m)}$ $(m = 1, 2)$ with

$$\begin{bmatrix}b_0 & \xi_0\end{bmatrix}\begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} = 0\,, \quad \delta_B\begin{bmatrix}\Phi_{(3,-1)}\\ \Phi_{(3,-2)}\end{bmatrix} = \mathrm{bpz}\left(\begin{bmatrix}b_0 & 0\\ \xi_0 & b_0\\ 0 & \xi_0\end{bmatrix}\right)\begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix}. \tag{2.35}$$

- The Grassmann-odd auxiliary string fields $N_{(4,-m)}$ $(1 \le m \le 3)$ with

$$\begin{bmatrix}c_0 & 0 & 0\\ \eta_0 & c_0 & 0\\ 0 & \eta_0 & c_0\\ 0 & 0 & \eta_0\end{bmatrix}\begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix} = 0\,, \quad \delta_B\begin{bmatrix}N_{(4,-1)}\\ N_{(4,-2)}\\ N_{(4,-3)}\end{bmatrix} = 0\,. \tag{2.36}$$

---

[11] In section 2.2, we shall see that the extended action (2.51) is invariant under the gauge transformation (2.30).

The resultant action is $S_0 + S_1 + S_2$ with

$$S_0 = -\frac{\mathrm{i}}{2}\left\langle \Phi_{(0,0)}, Q\eta_0\,\Phi_{(0,0)}\right\rangle , \tag{2.37a}$$

$$S_1 = \underbrace{-\left\langle \Phi_{(2,-1)}, \begin{bmatrix} Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle}_{S_1^{\mathrm{FP}}} + \underbrace{\left\langle \mathrm{bpz}\left(\begin{bmatrix} b_0 \\ \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(3,-1)} \\ N_{(3,-2)} \end{bmatrix}, \Phi_{(0,0)} \right\rangle}_{S_1^{\mathrm{GF}}} , \tag{2.37b}$$

$$S_2 = \underbrace{-\left\langle \begin{bmatrix} \Phi_{(3,-1)} \\ \Phi_{(3,-2)} \end{bmatrix}, \begin{bmatrix} Q & \eta_0 & 0 \\ 0 & Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-2,0)} \\ \Phi_{(-2,1)} \\ \Phi_{(-2,2)} \end{bmatrix} \right\rangle}_{S_2^{\mathrm{FP}}} + \underbrace{\left\langle \mathrm{bpz}\left(\begin{bmatrix} b_0 & 0 \\ \xi_0 & b_0 \\ 0 & \xi_0 \end{bmatrix} \right) \begin{bmatrix} N_{(4,-1)} \\ N_{(4,-2)} \\ N_{(4,-3)} \end{bmatrix}, \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle}_{S_2^{\mathrm{GF}}} . \tag{2.37c}$$

(III) The final result

We can continue gauge fixing step by step in the above-mentioned manner. After the n-th ($n \geq 1$) step, we obtain the BRST-exact action

$$S_n = \delta_B \left\langle \boldsymbol{\Phi_{n+1}}, \boldsymbol{\Phi_{-(n-1)}} \right\rangle = \underbrace{-\left\langle \boldsymbol{\Phi_{n+1}}, \boldsymbol{Q_{n,n+1}}\boldsymbol{\Phi_{-n}} \right\rangle}_{S_n^{\mathrm{FP}}} + \underbrace{\left\langle \mathrm{bpz}(\boldsymbol{B_{n+1,n}})\, \boldsymbol{N_{n+2}}, \boldsymbol{\Phi_{-(n-1)}} \right\rangle}_{S_n^{\mathrm{GF}}} \quad (n \geq 1) , \tag{2.38}$$

and the completely gauge-fixed action is given by

$$\sum_{n=0}^{\infty} S_n = -\frac{\mathrm{i}}{2}\left\langle \boldsymbol{\Phi_0}, Q\eta_0 \boldsymbol{\Phi_0} \right\rangle - \sum_{n=1}^{\infty} \left\langle \boldsymbol{\Phi_{n+1}}, \boldsymbol{Q_{n,n+1}}\boldsymbol{\Phi_{-n}} \right\rangle + \sum_{n=1}^{\infty} \left\langle \mathrm{bpz}(\boldsymbol{B_{n+1,n}})\, \boldsymbol{N_{n+2}}, \boldsymbol{\Phi_{-(n-1)}} \right\rangle \tag{2.39}$$

with the constraints

$$b_0 \xi_0 \boldsymbol{\Phi_2} = 0 , \quad \widetilde{\boldsymbol{B}}_{\boldsymbol{n-1,n}}\, \boldsymbol{\Phi_{n+1}} = 0 \quad (n \geq 2) , \tag{2.40}$$

$$\boldsymbol{C_{n+2,n+1}}\boldsymbol{N_{n+2}} = 0 \quad (n \geq 1) . \tag{2.41}$$

Here we have defined

$$\boldsymbol{\Phi_{-n}} := \left. \begin{bmatrix} \Phi_{(-n,0)} \\ \vdots \\ \Phi_{(-n,n)} \end{bmatrix} \right\} n+1 \quad (n \geq 0) , \quad \boldsymbol{\Phi_{n+1}} := \left. \begin{bmatrix} \Phi_{(n+1,-1)} \\ \vdots \\ \Phi_{(n+1,-n)} \end{bmatrix} \right\} n \quad (n \geq 1) , \tag{2.42}$$

$$\boldsymbol{N_{n+2}} := \left. \begin{bmatrix} N_{(n+2,-1)} \\ \vdots \\ N_{(n+2,-(n+1))} \end{bmatrix} \right\} n+1 \quad (n \geq 1) , \tag{2.43}$$

$$\boldsymbol{Q_{n,n+1}} := \underbrace{\left.\begin{bmatrix} Q & \eta_0 & & & 0 \\ & \ddots & \ddots & & \\ 0 & & & Q & \eta_0 \end{bmatrix}\right\}}_{n+1} n \quad (n \geq 1)\,, \quad \boldsymbol{B_{n+1,n}} := \underbrace{\left.\begin{bmatrix} b_0 & & 0 \\ \xi_0 & \ddots & \\ & \ddots & b_0 \\ 0 & & \xi_0 \end{bmatrix}\right\}}_{n} n+1 \quad (n \geq 1)\,, \tag{2.44}$$

$$\widetilde{\boldsymbol{B}}_{\boldsymbol{n-1,n}} := \underbrace{\left.\begin{bmatrix} b_0 & \xi_0 & & & 0 \\ & \ddots & \ddots & & \\ 0 & & & b_0 & \xi_0 \end{bmatrix}\right\}}_{n} n-1 \quad (n \geq 2)\,, \quad \boldsymbol{C_{n+2,n+1}} := \underbrace{\left.\begin{bmatrix} c_0 & & 0 \\ \eta_0 & \ddots & \\ & \ddots & c_0 \\ 0 & & \eta_0 \end{bmatrix}\right\}}_{n+1} n+2 \quad (n \geq 1)\,, \tag{2.45}$$

$$\delta_B \boldsymbol{\Phi_{-n}} = \boldsymbol{Q_{n+1,n+2}}\, \boldsymbol{\Phi_{-(n+1)}} \quad (n \geq 0)\,, \tag{2.46a}$$

$$\delta_B \boldsymbol{\Phi_{n+1}} = \mathrm{bpz}(\boldsymbol{B_{n+1,n}})\, \boldsymbol{N_{n+2}} \quad (n \geq 1)\,, \tag{2.46b}$$

$$\delta_B \boldsymbol{N_{n+2}} = 0 \quad (n \geq 1)\,. \tag{2.46c}$$

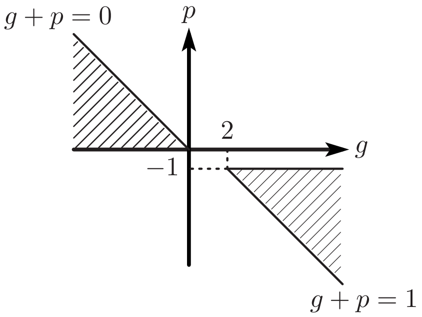

Figure 1: Distribution of allowed (g, p).

The string fields $\Phi_{(-n,m)}$ $(1 \leq n,\ 0 \leq m \leq n)$, $\Phi_{(n+1,-m)}$ $(1 \leq m \leq n)$, and $N_{(n+2,-m)}$ $(1 \leq n,\ 1 \leq m \leq n+1)$ are ghosts, antighosts, and auxiliary fields, respectively. A string field $\Phi_{(g,p)}$ is admissible only when the lattice point (g, p) belongs to the region shown in figure 1: the original field $\Phi_{(0,0)}$ and ghosts reside in the left region, and antighosts reside in the right region. The subscripts on the vectors $\boldsymbol{\Phi}$ and $\boldsymbol{N}$ indicate their world-sheet ghost numbers, whereas those on the matrices $\boldsymbol{Q}$, $\boldsymbol{B}$, $\widetilde{\boldsymbol{B}}$, and $\boldsymbol{C}$ indicate the sizes of the matrices. In what follows, unless otherwise stated, we use the same notation: the ghost number g of a vector $\boldsymbol{V}$ and the size $m \times n$ of a matrix $\boldsymbol{M}$ are indicated by their subscripts as in $\boldsymbol{V_g}$ and $\boldsymbol{M_{m,n}}$. Note that all the ghosts are Grassmann even, and all the antighosts and all the auxiliary fields are Grassmann odd, so that the vectors $\boldsymbol{\Phi_{-n}}$, $\boldsymbol{\Phi_{n+1}}$, and $\boldsymbol{N_{n+2}}$ have definite Grassmann parities:

$$\epsilon(\boldsymbol{\Phi_{-n}}) \equiv 0 \quad (n \geq 0)\,, \quad \epsilon(\boldsymbol{\Phi_{n+1}}) \equiv 1 \quad (n \geq 1)\,, \quad \epsilon(\boldsymbol{N_{n+2}}) \equiv 1 \quad (n \geq 1)\,. \tag{2.47}$$

By construction, the action (2.39) is invariant under the BRST transformation (2.46), whose nilpotency is guaranteed by

$$\boldsymbol{Q_{n+1,n+2}}\, \boldsymbol{Q_{n+2,n+3}} = 0 \quad (n \geq 0)\,. \tag{2.48}$$

We would like to add that the constraints (2.40) are consistent with the transformations (2.46b) because we have

$$b_0\xi_0\,\mathrm{bpz}(\boldsymbol{B}_{\boldsymbol{2,1}})=0\,,\quad \widetilde{\boldsymbol{B}}_{\boldsymbol{n-1,n}}\,\mathrm{bpz}(\boldsymbol{B}_{\boldsymbol{n+1,n}})=0\quad (n\geq 2)\,. \tag{2.49}$$

2.2 The extended action and its relation to gauge fixing

Let us decompose the completely gauge-fixed action (2.39) into two parts:

$$\sum_{n=0}^{\infty} S_n = S + S^{\mathrm{GF}}\,, \tag{2.50}$$

$$S := S_0 + \sum_{n=1}^{\infty} S_n^{\mathrm{FP}} = -\frac{\mathrm{i}}{2}\,\langle \boldsymbol{\Phi}_{\boldsymbol{0}}, Q\eta_0\boldsymbol{\Phi}_{\boldsymbol{0}}\rangle - \sum_{n=1}^{\infty}\big\langle \boldsymbol{\Phi}_{\boldsymbol{n+1}}, \boldsymbol{Q}_{\boldsymbol{n,n+1}}\boldsymbol{\Phi}_{\boldsymbol{-n}}\big\rangle\,, \tag{2.51}$$

$$S^{\mathrm{GF}} := \sum_{n=1}^{\infty} S_n^{\mathrm{GF}} = \sum_{n=1}^{\infty}\big\langle \mathrm{bpz}(\boldsymbol{B}_{\boldsymbol{n+1,n}})\,\boldsymbol{N}_{\boldsymbol{n+2}}\,, \boldsymbol{\Phi}_{\boldsymbol{-(n-1)}}\big\rangle = -\sum_{n=1}^{\infty}\big\langle \boldsymbol{N}_{\boldsymbol{n+2}}\,, \boldsymbol{B}_{\boldsymbol{n+1,n}}\boldsymbol{\Phi}_{\boldsymbol{-(n-1)}}\big\rangle\,. \tag{2.52}$$

The extended action (2.51) is invariant under the gauge transformations (recall eq. (2.48))

$$\boldsymbol{\Phi}_{\boldsymbol{-n}} \longrightarrow \boldsymbol{\Phi}_{\boldsymbol{-n}} + \boldsymbol{Q}_{\boldsymbol{n+1,n+2}}\boldsymbol{\Lambda}_{\boldsymbol{-(n+1)}}\,,\quad \boldsymbol{\Lambda}_{\boldsymbol{-(n+1)}} := \left.\begin{bmatrix}\Lambda_{(-(n+1),0)}\\ \vdots \\ \Lambda_{(-(n+1),n+1)}\end{bmatrix}\right\}n+2\quad (n\geq 0)\,, \tag{2.53}$$

from which the BRST transformations (2.46a) originate. The other action (2.52) plays the role of the gauge-fixing terms for these symmetries, imposing the conditions

$$\boldsymbol{B}_{\boldsymbol{n+2,n+1}}\,\boldsymbol{\Phi}_{\boldsymbol{-n}} = 0\quad (n\geq 0)\,. \tag{2.54}$$

In order to investigate symmetries of S further, suppose that antighosts are *not* subject to the constraints (2.40). Then, we find that S is also invariant under the gauge transformations of antighosts

$$\boldsymbol{\Phi}_{\boldsymbol{2}} \longrightarrow \boldsymbol{\Phi}_{\boldsymbol{2}} + Q\eta_0\,\boldsymbol{\Lambda}_{\boldsymbol{0}}\,,\quad \boldsymbol{\Phi}_{\boldsymbol{n+2}} \longrightarrow \boldsymbol{\Phi}_{\boldsymbol{n+2}} + \boldsymbol{Q}_{\boldsymbol{n+1,n}}\,\boldsymbol{\Lambda}_{\boldsymbol{n+1}}\quad (n\geq 1) \tag{2.55}$$

with

$$\boldsymbol{\Lambda}_{\boldsymbol{0}} := \Lambda_{(0,0)}\,,\quad \boldsymbol{\Lambda}_{\boldsymbol{n+1}} := \left.\begin{bmatrix}\Lambda_{(n+1,-1)}\\ \vdots \\ \Lambda_{(n+1,-n)}\end{bmatrix}\right\}n\quad (n\geq 1)\,, \tag{2.56}$$

$$\boldsymbol{Q}_{\boldsymbol{n+1,n}} := \underbrace{\left.\begin{bmatrix}Q & & 0\\ \eta_0 & \ddots & \\ & \ddots & Q\\ 0 & & \eta_0\end{bmatrix}\right\}}_{n} n+1\quad = -\mathrm{bpz}(\boldsymbol{Q}_{\boldsymbol{n,n+1}})\quad (n\geq 1)\,. \tag{2.57}$$

The point is that *the constraints* (2.40) *play exactly the role of the gauge-fixing conditions that eliminate these symmetries.* In fact, starting from the extended action (2.51), we can obtain a variety of completely gauge-fixed BRST-invariant actions in the following manner.[12]

1. In order to eliminate the gauge symmetries of the extended action,

$$\boldsymbol{\Phi_{-n}} \longrightarrow \boldsymbol{\Phi_{-n}} + \boldsymbol{Q_{n+1,n+2}}\boldsymbol{\Lambda_{-(n+1)}} \qquad (n \geq 0)\,, \tag{2.58a}$$

$$\boldsymbol{\Phi_2} \longrightarrow \boldsymbol{\Phi_2} + Q\eta_0\boldsymbol{\Lambda_0}\,, \quad \boldsymbol{\Phi_{n+2}} \longrightarrow \boldsymbol{\Phi_{n+2}} + \boldsymbol{Q_{n+1,n}}\boldsymbol{\Lambda_{n+1}} \quad (n \geq 1)\,, \tag{2.58b}$$

   we impose gauge-fixing conditions on the original field $\boldsymbol{\Phi_0}$, the ghosts $\boldsymbol{\Phi_{-n}}$ $(n \geq 1)$, and the antighosts $\boldsymbol{\Phi_{n+2}}$ $(n \geq 0)$. For example, we may use conditions of the form

$$\boldsymbol{B_{n+2,n+1}}\boldsymbol{\Phi_{-n}} = 0 \quad (n \geq 0)\,, \tag{2.59a}$$

$$\widetilde{\boldsymbol{B}}_{\boldsymbol{m(n),n+1}}\boldsymbol{\Phi_{n+2}} = 0 \quad (n \geq 0)\,, \tag{2.59b}$$

   where the number $m(n)$ depends on n. (The matrices $\boldsymbol{B}$ and $\widetilde{\boldsymbol{B}}$ do not have to be of the same form as those in eqs. (2.44) and (2.45).) Compatibility with the BRST transformation to be given in eq. (2.63) requires that $\boldsymbol{B}$ and $\widetilde{\boldsymbol{B}}$ satisfy

$$\widetilde{\boldsymbol{B}}_{\boldsymbol{m(n),n+1}}\,\mathrm{bpz}(\boldsymbol{B_{n+2,n+1}}) = 0 \quad (n \geq 0)\,. \tag{2.60}$$

2. The conditions on antighosts (2.59b) are imposed directly, whereas those on the original field and ghosts (2.59a) are realized indirectly by adding the gauge-fixing term

$$S^{\mathrm{GF}} = \sum_{n=1}^{\infty}\big\langle \mathrm{bpz}(\boldsymbol{B_{n+1,n}})\,\boldsymbol{N_{n+2}}\,, \boldsymbol{\Phi_{-(n-1)}}\big\rangle = -\sum_{n=1}^{\infty}\big\langle \boldsymbol{N_{n+2}}\,, \boldsymbol{B_{n+1,n}}\boldsymbol{\Phi_{-(n-1)}}\big\rangle\,. \tag{2.61}$$

   The resultant action

$$\begin{aligned} S + S^{\mathrm{GF}} = {} & -\frac{\mathrm{i}}{2}\langle \boldsymbol{\Phi_0}, Q\eta_0\boldsymbol{\Phi_0}\rangle - \sum_{n=1}^{\infty}\big\langle \boldsymbol{\Phi_{n+1}}, \boldsymbol{Q_{n,n+1}}\boldsymbol{\Phi_{-n}}\big\rangle \\ & + \sum_{n=1}^{\infty}\big\langle \mathrm{bpz}(\boldsymbol{B_{n+1,n}})\,\boldsymbol{N_{n+2}}\,, \boldsymbol{\Phi_{-(n-1)}}\big\rangle \end{aligned} \tag{2.62}$$

   is invariant under the BRST transformation

$$\delta_B\boldsymbol{\Phi_{-n}} = \boldsymbol{Q_{n+1,n+2}}\,\boldsymbol{\Phi_{-(n+1)}} \quad (n \geq 0)\,, \tag{2.63a}$$

$$\delta_B\boldsymbol{\Phi_{n+2}} = \mathrm{bpz}(\boldsymbol{B_{n+2,n+1}})\,\boldsymbol{N_{n+3}} \quad (n \geq 0)\,, \tag{2.63b}$$

$$\delta_B\boldsymbol{N_{n+3}} = 0 \quad (n \geq 0)\,, \tag{2.63c}$$

   because it is the sum of the original action S_0 and BRST-exact terms.

---

[12] A similar approach is adopted in refs. [25, 28].

Note that in order to remove redundant symmetries associated with auxiliary fields, we have to restrict their space as well, as in eq. (2.41). However, we do not have to specify the restrictions. Suppose that we have integrated out all the auxiliary fields. Then, what remains is only the action S with the constraints (2.59), and it does not include auxiliary fields any longer. In the rest of the present paper, we merely use this "partially integrated" version of the action. Therefore, we do not need the specific forms of the restrictions on auxiliary fields.[13]

From the above point of view, the extended action S is *universal*, and various gauge-fixed actions can be obtained *merely by taking different gauge-fixing matrices*. This is a reflection of the fact that S is essentially the solution to the classical master equation, namely the classical part of the quantum master equation in the BV formalism [1]. For the relation between S and the classical master equation, see ref. [18].

Now that we have seen how to obtain BRST-invariant actions in general gauges, let us extend the conditions considered in section 2.1:

$$b_0\Phi_{(-n,0)} = 0 \quad (n\geq 0)\,, \tag{2.64a}$$

$$\xi_0\Phi_{(-n,m)} + b_0\Phi_{(-n,m+1)} = 0 \quad (0\leq m\leq n-1)\,, \tag{2.64b}$$

$$\xi_0\Phi_{(-n,n)} = 0 \quad (n\geq 0)\,, \tag{2.64c}$$

$$b_0\xi_0\Phi_{(2,-1)} = 0\,, \tag{2.65a}$$

$$b_0\Phi_{(n+2,-m)} + \xi_0\Phi_{(n+2,-(m+1))} = 0 \quad (1\leq m\leq n)\,. \tag{2.65b}$$

For this purpose, we introduce two real parameters x and y with $(x,y)\neq(0,0)$, and rescale b_0 and ξ_0 in eqs. (2.64b) and (2.65b) as $b_0\to xb_0$, $\xi_0\to y\xi_0$. This procedure provides a new set of gauge-fixing conditions, replacing eqs. (2.64b) and (2.65b) with

$$y\xi_0\Phi_{(-n,m)} + xb_0\Phi_{(-n,m+1)} = 0 \quad (0\leq m\leq n-1)\,, \tag{2.66}$$

$$xb_0\Phi_{(n+2,-m)} + y\xi_0\Phi_{(n+2,-(m+1))} = 0 \quad (1\leq m\leq n)\,. \tag{2.67}$$

In these gauges, however, cases in which $x=0$ or $y=0$ are exceptional: if $x=0$ (resp. $y=0$), the antighosts $\Phi_{(n+2,-1)}$ (resp. $\Phi_{(n+2,-(n+1))}$) $(n\geq 1)$ are not subject to any constraints. To remedy this, we introduce the supplementary conditions

$$b_0\xi_0\Phi_{(n+2,-1)} = 0 \quad (n\geq 1)\,, \tag{2.68a}$$

$$b_0\xi_0\Phi_{(n+2,-(n+1))} = 0 \quad (n\geq 1)\,. \tag{2.68b}$$

---

[13] Validity of condition (2.41) can be proved in the same manner as in section 4 and appendix C.

Multiplying eq. (2.67) by ξ_0 or b_0 from the left, we obtain

$$0 = \xi_0\big(x b_0 \Phi_{(n+2,-1)} + y \xi_0 \Phi_{(n+2,-2)}\big) = -x b_0 \xi_0 \Phi_{(n+2,-1)}\,, \tag{2.69a}$$

$$0 = b_0\big(x b_0 \Phi_{(n+2,-n)} + y \xi_0 \Phi_{(n+2,-(n+1))}\big) = y b_0 \xi_0 \Phi_{(n+2,-(n+1))}\,. \tag{2.69b}$$

Thus, if $x \neq 0$ (resp. $y \neq 0$), eq. (2.68a) (resp. (2.68b)) follows from eq. (2.67). However, if $x = 0$ (resp. $y = 0$), it supplies additional constraints. New gauge-fixing matrices are given by

$$\boldsymbol{B}^{\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2},\boldsymbol{n+1}} := \left.\underbrace{\left[\begin{array}{ccccc} b_0 & 0 & \dots & \dots & 0 \\ \hline y\xi_0 & x b_0 & & & \mathbf{0} \\ & y\xi_0 & x b_0 & & \\ & & \ddots & \ddots & \\ \mathbf{0} & & & y\xi_0 & x b_0 \\ \hline 0 & \dots & \dots & 0 & \xi_0 \end{array}\right]}_{n+1}\right\} n+2 \qquad (n \geq 0)\,, \tag{2.70}$$

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2},\boldsymbol{n+1}} := \left.\underbrace{\left[\begin{array}{ccccc} b_0\xi_0 & 0 & \dots & \dots & 0 \\ \hline x b_0 & y\xi_0 & & & \mathbf{0} \\ & x b_0 & y\xi_0 & & \\ & & \ddots & \ddots & \\ \mathbf{0} & & & x b_0 & y\xi_0 \\ \hline 0 & \dots & \dots & 0 & b_0\xi_0 \end{array}\right]}_{n+1}\right\} n+2 \qquad (n \geq 0)\,. \tag{2.71}$$

The two lines drawn in $\boldsymbol{B}$ (resp. $\widetilde{\boldsymbol{B}}$) indicate the boundaries among the three submatrices associated with the three types of gauge-fixing conditions (2.64a), (2.66), and (2.64c) (resp. (2.68a), (2.67), and (2.68b)). We can readily confirm that the above matrices satisfy the compatibility conditions (2.60).

Thus far, we have been considering only those gauge-fixing matrices composed of b_0 and ξ_0. However, it is also interesting to use, instead of ξ_0, the zero mode of the primary operator $d := [Q, b\xi]$, which has the same ghost number and picture number as ξ. As a matter of fact, η_0 and d_0 are the counterparts of Q and b_0 in the twisted $N = 2$ superconformal algebra investigated by Berkovits and Vafa [29].[14] The crucial point is that algebraic relations are symmetric in b_0 and d_0:

$$b_0^2 = d_0^2 = \{b_0, d_0\} = \{Q, d_0\} = \{\eta_0, b_0\} = 0\,, \quad \{Q, b_0\} = \{\eta_0, d_0\} = L_0\,. \tag{2.72}$$

As we shall see, in virtue of these properties, the propagators in b_0-d_0 gauges are much simpler than those in b_0-ξ_0 gauges.

---

[14] The operators Q, η_0, b_0, and d_0 are identical to G_0^+, $\widetilde{G}_0^+$, G_0^-, and $\widetilde{G}_0^-$, respectively, in section 5 of ref. [29]. Useful algebraic relations are summarized in appendix A.

Here is another remark on the forms of the matrices (2.70) and (2.71): one does not have to use the same (x, y) for every n. In the next section, a larger class of gauge-fixing matrices will be proposed.

3 Gauge-fixing conditions

We consider a class of gauge-fixing conditions of the form

$$\boldsymbol{B}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1}\boldsymbol{\Phi}_{-n} = 0 \quad (n \geq 0)\,, \tag{3.1a}$$

$$\widetilde{\boldsymbol{B}}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1}\boldsymbol{\Phi}_{n+2} = 0 \quad (n \geq 0)\,, \tag{3.1b}$$

where

$$\boldsymbol{B}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1} := \left.\underbrace{\left[\begin{array}{ccccc} b_0 & 0 & \cdots & \cdots & 0 \\ \hline y_n\zeta_0^{(n)} & x_n b_0 & & & \text{\Large 0} \\ & y_n\zeta_0^{(n)} & x_n b_0 & & \\ & & \ddots & \ddots & \\ \text{\Large 0} & & & y_n\zeta_0^{(n)} & x_n b_0 \\ \hline 0 & \cdots & \cdots & 0 & \zeta_0^{(n)} \end{array}\right]}_{n+1}\right\} n+2 \qquad (n \geq 0)\,, \tag{3.2}$$

$$\widetilde{\boldsymbol{B}}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1} := \left.\underbrace{\left[\begin{array}{ccccc} b_0\zeta_0^{(n)} & 0 & \cdots & \cdots & 0 \\ \hline x_n b_0 & y_n\zeta_0^{(n)} & & & \text{\Large 0} \\ & x_n b_0 & y_n\zeta_0^{(n)} & & \\ & & \ddots & \ddots & \\ \text{\Large 0} & & & x_n b_0 & y_n\zeta_0^{(n)} \\ \hline 0 & \cdots & \cdots & 0 & b_0\zeta_0^{(n)} \end{array}\right]}_{n+1}\right\} n+2 \qquad (n \geq 0)\,. \tag{3.3}$$

Here x_n and y_n $(n \geq 0)$ are real parameters satisfying $(x_n, y_n) \neq (0, 0)$, and $\zeta_0^{(n)}$ $(n \geq 0)$ are either ξ_0 or d_0. The quantum number (g, p) of $\zeta_0^{(n)}$ is $(-1, 1)$, and we have

$$b_0^2 = \big(\zeta_0^{(n)}\big)^2 = \big\{b_0, \zeta_0^{(n)}\big\} = 0\,. \tag{3.4}$$

As will be mentioned in section 4.1, when $\zeta_0^{(n)} = d_0$, we have to require the condition $x_n + y_n \neq 0$ as well. It should be mentioned that the gauges (3.1) depend on x_n and y_n only through the *ratio* of x_n to y_n. In order to avoid misunderstanding, we write down the forms of small-size matrices explicitly.

(As one can see from the equations below, the matrices $\boldsymbol{B}_{\boldsymbol{2,1}}^{\boldsymbol{\zeta_0^{(0)};x_0,y_0}}$ and $\widetilde{\boldsymbol{B}}_{\boldsymbol{2,1}}^{\boldsymbol{\zeta_0^{(0)};x_0,y_0}}$ are independent of x_0 and y_0.)

$$\boldsymbol{B}_{\boldsymbol{2,1}}^{\boldsymbol{\zeta_0^{(0)};x_0,y_0}} = \left[\begin{array}{c} b_0 \\ \\ \zeta_0^{(0)} \end{array}\right], \quad \boldsymbol{B}_{\boldsymbol{3,2}}^{\boldsymbol{\zeta_0^{(1)};x_1,y_1}} = \left[\begin{array}{cc} b_0 & 0 \\ \hline y_1\zeta_0^{(1)} & x_1 b_0 \\ \hline 0 & \zeta_0^{(1)} \end{array}\right], \quad \boldsymbol{B}_{\boldsymbol{4,3}}^{\boldsymbol{\zeta_0^{(2)};x_2,y_2}} = \left[\begin{array}{ccc} b_0 & 0 & 0 \\ \hline y_2\zeta_0^{(2)} & x_2 b_0 & 0 \\ 0 & y_2\zeta_0^{(2)} & x_2 b_0 \\ \hline 0 & 0 & \zeta_0^{(2)} \end{array}\right], \tag{3.5}$$

$$\widetilde{\boldsymbol{B}}_{\boldsymbol{2,1}}^{\boldsymbol{\zeta_0^{(0)};x_0,y_0}} = \left[\begin{array}{c} b_0\zeta_0^{(0)} \\ \\ b_0\zeta_0^{(0)} \end{array}\right], \quad \widetilde{\boldsymbol{B}}_{\boldsymbol{3,2}}^{\boldsymbol{\zeta_0^{(1)};x_1,y_1}} = \left[\begin{array}{cc} b_0\zeta_0^{(1)} & 0 \\ \hline x_1 b_0 & y_1\zeta_0^{(1)} \\ \hline 0 & b_0\zeta_0^{(1)} \end{array}\right], \quad \widetilde{\boldsymbol{B}}_{\boldsymbol{4,3}}^{\boldsymbol{\zeta_0^{(2)};x_2,y_2}} = \left[\begin{array}{ccc} b_0\zeta_0^{(2)} & 0 & 0 \\ \hline x_2 b_0 & y_2\zeta_0^{(2)} & 0 \\ 0 & x_2 b_0 & y_2\zeta_0^{(2)} \\ \hline 0 & 0 & b_0\zeta_0^{(2)} \end{array}\right]. \tag{3.6}$$

Obviously, eq. (3.1b) can be decomposed as follows:

$$b_0\zeta_0^{(n)}\Phi_{(n+2,-1)} = 0 \qquad (n \geq 0)\,, \tag{3.7a}$$

$$n\left\{\underbrace{\begin{bmatrix} x_n b_0 & y_n\zeta_0^{(n)} & & & \\ & x_n b_0 & y_n\zeta_0^{(n)} & & \boldsymbol{\huge 0} \\ & & \ddots & \ddots & \\ \boldsymbol{\huge 0} & & & x_n b_0 & y_n\zeta_0^{(n)} \end{bmatrix}}_{n+1}\right. \begin{bmatrix} \Phi_{(n+2,-1)} \\ \vdots \\ \Phi_{(n+2,-(n+1))} \end{bmatrix} = 0 \qquad (n \geq 1)\,, \tag{3.7b}$$

$$b_0\zeta_0^{(n)}\Phi_{(n+2,-(n+1))} = 0 \qquad (n \geq 0)\,. \tag{3.7c}$$

Note that if $x_n \neq 0$ $(n \geq 1)$ (resp. $y_n \neq 0$ $(n \geq 1)$), condition (3.7a) (resp. (3.7c)) follows from (3.7b), and thus we do not need that condition, but if not, it is independent of (3.7b). Note also that when $n = 0$, condition (3.1b) is reduced to $b_0\zeta_0^{(0)}\boldsymbol{\Phi_2} = 0$.

The above class of gauge-fixing conditions contains two types of gauges for *each* $n \geq 0$. One is b_0-ξ_0 gauges, in which $\zeta_0^{(n)} = \xi_0$, and the other is b_0-d_0 gauges, in which $\zeta_0^{(n)} = d_0$. Both of these are consistent with the BRST symmetry, because

$$\widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}} \mathrm{bpz}\left(\boldsymbol{B}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}\right) = 0 \quad (n \geq 0)\,. \tag{3.8}$$

It can be readily confirmed that we also have

$$\boldsymbol{B}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}} \mathrm{bpz}\left(\widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}\right) = 0 \quad (n \geq 0)\,. \tag{3.9}$$

We would like to emphasize that one does not have to adopt the same type of gauge-fixing conditions for *every* $n \geq 0$. However, the simplest choice would be

$$\zeta_0^{(0)} = \zeta_0^{(1)} = \zeta_0^{(2)} = \cdots , \quad x_0 = x_1 = x_2 = \cdots , \quad y_0 = y_1 = y_2 = \cdots . \tag{3.10}$$

In the next section (and in appendix C), we investigate the validity of the gauge-fixing conditions (3.1) in detail.

4 Validity of the gauge-fixing conditions

4.1 On-shell values of L_0

In general, on-shell gauge structure is a little different from the off-shell one. Before considering the validity of the conditions (3.1), let us see what values L_0 can take on the mass shell. We first consider the equation of motion of $\Phi_{(0,0)}$

$$Q\eta_0\Phi_{(0,0)} = 0 \tag{4.1}$$

under the gauge-fixing condition

$$\boldsymbol{B}_{\boldsymbol{2,1}}^{\boldsymbol{\zeta_0;x,y}}\boldsymbol{\Phi_0} = 0 , \quad \text{i.e.,} \quad b_0\Phi_{(0,0)} = \zeta_0\Phi_{(0,0)} = 0 . \tag{4.2}$$

Here and in the sequel, $\boldsymbol{B}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0;x,y}}$ should be understood as $\big[\boldsymbol{B}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}\big]_{\zeta_0^{(n)}=\zeta_0,\, x_n=x,\, y_n=y}$, with ζ denoting either ξ or d (and thus ζ_0 denoting either ξ_0 or d_0). From eqs. (4.1) and (4.2) we obtain

$$0 = \zeta_0 b_0 Q\eta_0\Phi_{(0,0)} = \zeta_0\big(L_0 - Qb_0\big)\eta_0\Phi_{(0,0)} = L_0\zeta_0\eta_0\Phi_{(0,0)} = L_0\big(\overline{L}_0 - \eta_0\zeta_0\big)\Phi_{(0,0)} = L_0\overline{L}_0\Phi_{(0,0)} \tag{4.3}$$

with

$$\overline{L}_0 := \{\eta_0, \zeta_0^{(n)}\} = \begin{cases} 1 & \big(\text{for } \zeta_0^{(n)} = \xi_0\big), \\ L_0 & \big(\text{for } \zeta_0^{(n)} = d_0\big). \end{cases} \tag{4.4}$$

Eq. (4.3) tells us that on the mass shell of $\Phi_{(0,0)}$, we have $L_0 = 0$.

As a next example, let us consider the equation of motion

$$Q\Phi_{(-1,0)} + \eta_0\Phi_{(-1,1)} = 0 \tag{4.5}$$

originating from the ghost action

$$-\left\langle \Phi_{(2,-1)} , \begin{bmatrix} Q & \eta_0 \end{bmatrix} \begin{bmatrix} \Phi_{(-1,0)} \\ \Phi_{(-1,1)} \end{bmatrix} \right\rangle = -\big\langle \Phi_{(2,-1)} , Q\Phi_{(-1,0)} + \eta_0\Phi_{(-1,1)} \big\rangle . \tag{4.6}$$

If we impose the condition

$$\boldsymbol{B}_{\boldsymbol{3,2}}^{\boldsymbol{\zeta_0;x,y}}\boldsymbol{\Phi_{-1}} = 0 , \quad \text{i.e.,} \quad \begin{cases} b_0\Phi_{(-1,0)} = 0 , \\ y\zeta_0\Phi_{(-1,0)} + x b_0\Phi_{(-1,1)} = 0 , \\ \zeta_0\Phi_{(-1,1)} = 0 , \end{cases} \tag{4.7}$$

then we obtain

$$\begin{aligned} 0 &= x\zeta_0 b_0 \big(Q\Phi_{(-1,0)} + \eta_0 \Phi_{(-1,1)}\big) = x\zeta_0 (L_0 - Qb_0)\Phi_{(-1,0)} - \zeta_0\eta_0\big(x b_0 \Phi_{(-1,1)}\big) \\ &= x\zeta_0 L_0 \Phi_{(-1,0)} + \zeta_0\eta_0\big(y\zeta_0\Phi_{(-1,0)}\big) = \zeta_0 L_{x,y}\Phi_{(-1,0)}\,, \end{aligned} \tag{4.8}$$

with

$$L_{x,y} := xL_0 + y\overline{L}_0 = \begin{cases} xL_0 + y & \big(\text{for } \zeta_0^{(n)} = \xi_0\big), \\ (x+y)\,L_0 & \big(\text{for } \zeta_0^{(n)} = d_0\big). \end{cases} \tag{4.9}$$

Eq. (4.8) suggests that $L_{x,y}$ will be zero on the mass shell.

As we shall see in section 5, propagators indeed have poles at $L_0 = 0$ and $L_{x_n,y_n} = 0$. We would like to remark that when $\zeta_0^{(n)} = d_0$, we have to require $x_n + y_n \neq 0$ in order to exclude the case in which the operator $L_{x_n,y_n} = (x_n + y_n)\,L_0$ is trivially zero. The "off-shell conditions" $L_0 \neq 0$ and $L_{x_n,y_n} \neq 0$, which are reduced to $L_0 \neq 0$ and $x_n + y_n \neq 0$ for $\zeta_0^{(n)} = d_0$, will be assumed when we prove the validity of the gauge-fixing conditions.

4.2 Validity of the gauge-fixing conditions

In the present subsection (and in appendix C), we prove that *off the mass shell* the symmetries

$$\boldsymbol{\Phi_{-n}} \longrightarrow \boldsymbol{\Phi_{-n}} + \boldsymbol{Q_{n+1,n+2}}\boldsymbol{\Lambda_{-(n+1)}} \qquad (n \geq 0) \tag{4.10}$$

and

$$\boldsymbol{\Phi_2} \longrightarrow \boldsymbol{\Phi_2} + Q\eta_0\,\boldsymbol{\Lambda_0}\,, \quad \boldsymbol{\Phi_{n+2}} \longrightarrow \boldsymbol{\Phi_{n+2}} + \boldsymbol{Q_{n+1,n}}\boldsymbol{\Lambda_{n+1}} \quad (n \geq 1) \tag{4.11}$$

can be eliminated respectively by imposing the conditions

$$\boldsymbol{B}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi_{-n}} = 0 \quad (n \geq 0) \tag{4.12}$$

and

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi_{n+2}} = 0 \quad (n \geq 0)\,. \tag{4.13}$$

This involves two steps. We have to show reachability and completeness of the conditions.

1. **(Reachability)** By the use of the transformation (4.10) (resp. (4.11)), one can let the string fields $\Phi_{(-n,m)}$ $(0 \leq m \leq n)$ (resp. $\Phi_{(n+2,-m)}$ $(1 \leq m \leq n+1)$) reach the configuration where condition (4.12) (resp. (4.13)) holds.

2. **(Completeness)** If once condition (4.12) (or (4.13)) is imposed, there remains no residual gauge symmetry that preserves the condition. In other words, the condition eliminates the gauge degrees of freedom completely.

We first consider the reachability and the completeness of condition (4.12), and then consider those of (4.13). The way itself to prove the completeness is significant: byproducts of the proofs shall play an essential role when we derive propagators in section 5. In what follows, we assume the "off-shell conditions" $L_0 \neq 0$ and $L_{x_n,y_n} \neq 0$.

The validity of condition (4.12) is ensured by the following two propositions.[15] (For the proof of proposition 4.1, see appendix C.)

Proposition 4.1 (Reachability of (4.12)**)** *For any set of string fields of the form* $\{\Phi_{(-n,m)} \mid 0 \leq m \leq n\}$ *($n \geq 0$ is fixed), there exists a set of string fields* $\{\Lambda_{(-(n+1),m)} \mid 0 \leq m \leq n+1\}$ *such that*

$$\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2},\boldsymbol{n+1}}\Big(\boldsymbol{\Phi}_{-\boldsymbol{n}} + \boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n+2}}\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})}\Big) = 0 \quad (n \geq 0)\,. \tag{4.14}$$

Proposition 4.2 (Completeness of (4.12)**)** *Let* $\{\Phi_{(-n,m)} \mid 0 \leq m \leq n\}$ *be a set of string fields ($n \geq 0$ is fixed) satisfying*

$$\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2},\boldsymbol{n+1}}\boldsymbol{\Phi}_{-\boldsymbol{n}} = 0 \quad (n \geq 0)\,. \tag{4.15}$$

If the transformation

$$\boldsymbol{\Phi}_{-\boldsymbol{n}} \longrightarrow \boldsymbol{\Phi}'_{-\boldsymbol{n}} := \boldsymbol{\Phi}_{-\boldsymbol{n}} + \boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n+2}}\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})} \quad (n \geq 0) \tag{4.16}$$

preserves condition (4.15)*, then one obtains*

$$\boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n+2}}\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})} = 0\,, \quad \textit{i.e.,} \quad \boldsymbol{\Phi}'_{-\boldsymbol{n}} = \boldsymbol{\Phi}_{-\boldsymbol{n}} \quad (n \geq 0)\,. \tag{4.17}$$

(This proposition ensures that there exists no residual gauge symmetry of the form (4.16) *that preserves condition* (4.15)*.)*

Proof. Because the "transformation" parameterized by $\boldsymbol{\Theta}$

$$\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})} \longrightarrow \boldsymbol{\Lambda}_{-(\boldsymbol{n+1})} + \boldsymbol{Q}_{\boldsymbol{n+2},\boldsymbol{n+3}}\boldsymbol{\Theta}_{-(\boldsymbol{n+2})}\,, \quad \boldsymbol{\Theta}_{-(\boldsymbol{n+2})} := \begin{bmatrix} \Theta_{(-(n+2),0)} \\ \vdots \\ \Theta_{(-(n+2),n+2)} \end{bmatrix} \tag{4.18}$$

does not change the value of $\boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n+2}}\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})}$, we may assume

$$\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+3},\boldsymbol{n+2}}\boldsymbol{\Lambda}_{-(\boldsymbol{n+1})} = 0 \tag{4.19}$$

---

[15] In propositions 4.1 and 4.2, we intensionally use the symbols x, y, and ζ_0 rather than x_n, y_n, and $\zeta_0^{(n)}$, in order to avoid notational complexity in their proofs. One may think that in these propositions, only those gauge-fixing conditions satisfying eq. (3.10) are considered, but it is not the case. The point is that the propositions hold for *each* $n \geq 0$, without the assumption that x, y, and ζ_0, which are arbitrary as long as they satisfy $(x, y) \neq (0, 0)$ and $\zeta_0 \in \{\xi_0, d_0\}$, take the same values for *every* n. Hence it goes without saying that they hold even if x, y, and ζ_0 in eqs. (4.14) and (4.15) are replaced with x_n, y_n, and $\zeta_0^{(n)}$.

without loss of generality (see proposition 4.1).[16] Hence, for the purpose of proving the proposition, it is sufficient to show that under condition (4.19) we obtain

$$\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{Q}_{n+1,n+2}\boldsymbol{\Lambda}_{-(n+1)} = 0 \implies \boldsymbol{\Lambda}_{-(n+1)} = 0\,. \tag{4.20}$$

Indeed, if eq. (4.20) holds, then we find

$$\begin{aligned} &\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{\Phi}_{-n} = \boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{\Phi}'_{-n} = 0 \\ \implies &\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{Q}_{n+1,n+2}\boldsymbol{\Lambda}_{-(n+1)} = 0 \implies (4.17)\,, \end{aligned} \tag{4.21}$$

which completes the proof. Eq. (4.20) is ensured by showing the existence of an $(n+2)\times(n+2)$ matrix $\boldsymbol{P}^{\zeta_0;x,y}_{n+2,n+2}$ such that

$$\boldsymbol{P}^{\zeta_0;x,y}_{n+2,n+2}\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{Q}_{n+1,n+2} = \boldsymbol{1}_{n+2} + \boldsymbol{M}^{\zeta_0;xy}_{n+2,n+3}\boldsymbol{B}^{\zeta_0;x,y}_{n+3,n+2}\,. \tag{4.22}$$

Here $\boldsymbol{1}_{n+2}$ is the unit matrix of size $n+2$, and $\boldsymbol{M}^{\zeta_0;x,y}_{n+2,n+3}$ is some $(n+2)\times(n+3)$ matrix. Given eq. (4.22), we indeed obtain (4.20):

$$\begin{aligned} &\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{Q}_{n+1,n+2}\boldsymbol{\Lambda}_{-(n+1)} = 0 \\ \implies &0 = \Big(\boldsymbol{P}^{\zeta_0;x,y}_{n+2,n+2}\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\boldsymbol{Q}_{n+1,n+2}\Big)\boldsymbol{\Lambda}_{-(n+1)} = \Big(\boldsymbol{1}_{n+2} + \boldsymbol{M}^{\zeta_0;x,y}_{n+2,n+3}\boldsymbol{B}^{\zeta_0;x,y}_{n+3,n+2}\Big)\boldsymbol{\Lambda}_{-(n+1)} \\ \implies &\boldsymbol{\Lambda}_{-(n+1)} = 0 \quad (\because (4.19))\,. \end{aligned} \tag{4.23}$$

As a matter of fact, we can solve eq. (4.22) explicitly. The matrices $\boldsymbol{P}^{\zeta_0;x,y}_{n+2,n+2}$ and $\boldsymbol{M}^{\zeta_0;x,y}_{n+2,n+3}$ which solve eq. (4.22) are listed in appendix D. $\square$

Now that we have confirmed the validity of condition (4.12), let us see that of (4.13). The proof goes along the same lines. (For the proof of proposition 4.3, see appendix C.)

Proposition 4.3 (Reachability of (4.13)**)**
(A) *For any string field* $\Phi_{(2,-1)}$ *of indicated quantum number, there exists a string field* $\Lambda_{(0,0)}$ *such that*

$$b_0\zeta_0\left(\Phi_{(2,-1)} + Q\eta_0\Lambda_{(0,0)}\right) = 0\,. \tag{4.24}$$

(B) *Let* $n \geq 1$ *be fixed. For any set of string fields of the form* $\{\Phi_{(n+2,-m)} \mid 1 \leq m \leq n+1\}$, *there exists a set of string fields* $\{\Lambda_{(n+1,-m)} \mid 1 \leq m \leq n\}$ *such that*

$$\widetilde{\boldsymbol{B}}^{\zeta_0;x,y}_{n+2,n+1}\Big(\boldsymbol{\Phi}_{n+2} + \boldsymbol{Q}_{n+1,n}\boldsymbol{\Lambda}_{n+1}\Big) = 0 \quad (n \geq 1)\,. \tag{4.25}$$

---

[16] If one replaces the symbols x, y, and ζ_0 in eq. (4.15) with x_n, y_n, and $\zeta_0^{(n)}$, then those in eq. (4.19), also, have to be replaced with x_n, y_n, and $\zeta_0^{(n)}$, *not* with x_{n+1}, y_{n+1}, and $\zeta_0^{(n+1)}$. This does not mean, however, that we assume condition (3.10). We emphasize again that proposition 4.1 holds for *each* $n \geq 0$, with x, y, and ζ_0 arbitrary.

Proposition 4.4 (Completeness of (4.13)**)** *Let* $\{\Phi_{(n+2,-m)} \mid 1 \le m \le n+1\}$ *be a set of string fields* ($n \ge 0$ *is fixed*) *satisfying*

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \boldsymbol{\Phi_{n+2}} = 0 \quad (n \ge 0)\,. \tag{4.26}$$

If the transformation

$$\boldsymbol{\Phi_2} \longrightarrow \boldsymbol{\Phi_2} + Q\eta_0 \boldsymbol{\Lambda_0} \quad (\text{for } n = 0)\ , \tag{4.27a}$$

$$\boldsymbol{\Phi_{n+2}} \longrightarrow \boldsymbol{\Phi_{n+2}} + \boldsymbol{Q_{n+1,n}} \boldsymbol{\Lambda_{n+1}} \quad (\text{for } n \ge 1) \tag{4.27b}$$

preserves condition (4.26)*, then one obtains*

$$Q\eta_0 \boldsymbol{\Lambda_0} = 0 \quad (\text{for } n = 0)\ , \tag{4.28a}$$

$$\boldsymbol{Q_{n+1,n}} \boldsymbol{\Lambda_{n+1}} = 0 \quad (\text{for } n \ge 1)\,. \tag{4.28b}$$

Proof. The "transformation" parameterized by $\boldsymbol{\Theta}$

$$\boldsymbol{\Lambda_0} \longrightarrow \boldsymbol{\Lambda_0} + \boldsymbol{Q_{1,2}} \boldsymbol{\Theta_{-1}}\,, \quad \boldsymbol{\Theta_{-1}} := \begin{bmatrix} \Theta_{(-1,0)} \\ \Theta_{(-1,1)} \end{bmatrix} \quad (\text{for } n = 0)\ , \tag{4.29a}$$

$$\boldsymbol{\Lambda_2} \longrightarrow \boldsymbol{\Lambda_2} + Q\eta_0 \boldsymbol{\Theta_0}\,, \quad \boldsymbol{\Theta_0} := \Theta_{(0,0)} \quad (\text{for } n = 1)\ , \tag{4.29b}$$

$$\boldsymbol{\Lambda_{n+1}} \longrightarrow \boldsymbol{\Lambda_{n+1}} + \boldsymbol{Q_{n,n-1}} \boldsymbol{\Theta_n}\,, \quad \boldsymbol{\Theta_n} := \begin{bmatrix} \Theta_{(n,-1)} \\ \vdots \\ \Theta_{(n,-(n-1))} \end{bmatrix} \quad (\text{for } n \ge 2) \tag{4.29c}$$

does not affect the value of

$$Q\eta_0 \boldsymbol{\Lambda_0} \quad (\text{for } n = 0)\ , \tag{4.30a}$$

$$\boldsymbol{Q_{n+1,n}} \boldsymbol{\Lambda_{n+1}} \quad (\text{for } n \ge 1)\ . \tag{4.30b}$$

Therefore, we may assume

$$\boldsymbol{B}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{2,1}} \boldsymbol{\Lambda_0} = 0 \quad (\text{for } n = 0)\ , \tag{4.31a}$$

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \boldsymbol{\Lambda_{n+1}} = 0 \quad (\text{for } n \ge 1) \tag{4.31b}$$

without loss of generality (see propositions 4.1 and 4.3). Hence, for the purpose of proving the proposition, it is sufficient to show that under condition (4.31) we gain

$$b_0 \zeta_0 Q\eta_0 \boldsymbol{\Lambda_0} = 0 \implies \boldsymbol{\Lambda_0} = 0 \quad (\text{for } n = 0)\ , \tag{4.32a}$$

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \boldsymbol{Q_{n+1,n}} \boldsymbol{\Lambda_{n+1}} = 0 \implies \boldsymbol{\Lambda_{n+1}} = 0 \quad (\text{for } n \ge 1)\ . \tag{4.32b}$$

Eq. (4.32) is ensured by the existence of an operator $\boldsymbol{P}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,1}}$ (for the $n=0$ case) and of an $n\times(n+2)$ matrix $\widetilde{\boldsymbol{P}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+2}}$ (for the $n\geq 1$ case) such that

$$\boldsymbol{P}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,1}}\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,0}}\boldsymbol{Q}_{\boldsymbol{0,1}} = 1 + \boldsymbol{M}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,2}}\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{2,1}} \qquad (\text{for } n=0)\ , \tag{4.33a}$$

$$\widetilde{\boldsymbol{P}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+2}}\widetilde{\boldsymbol{B}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2,n+1}}\boldsymbol{Q}_{\boldsymbol{n+1,n}} = \boldsymbol{1_n} + \widetilde{\boldsymbol{M}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}\widetilde{\boldsymbol{B}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}} \qquad (\text{for } n\geq 1)\ . \tag{4.33b}$$

Here $\boldsymbol{1_n}$ is the unit matrix of size n, $\boldsymbol{M}^{\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,2}}$ is some 1×2 matrix, and $\widetilde{\boldsymbol{M}}^{\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}$ is some $n\times(n+1)$ matrix. We have defined $\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,0}}$ and $\boldsymbol{Q}_{\boldsymbol{0,1}}$ as

$$\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,0}} := b_0\zeta_0\,, \quad \boldsymbol{Q}_{\boldsymbol{0,1}} := \mathrm{i}\,Q\eta_0\,. \tag{4.34}$$

(Compare eq. (4.33a) with eq. (4.22).) The solutions to eq. (4.33) are listed in appendix D. ☐

4.3 Byproducts of the proofs

In the proofs of propositions 4.2 and 4.4, we have obtained interesting equations (4.22) and (4.33), which connect the gauge-fixing matrices $\boldsymbol{B}$'s and $\widetilde{\boldsymbol{B}}$'s with the kinetic-term matrices $\boldsymbol{Q}$'s in the extended action. In fact, the matrices

$$\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}} := \boldsymbol{P}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n+1}}\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}} \quad (n\geq 0)\,, \quad \widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}} := \widetilde{\boldsymbol{P}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+2}}\,\widetilde{\boldsymbol{B}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2,n+1}} \quad (n\geq 1)\,, \tag{4.35}$$

have a close relation to propagators. In the next section, we shall see that propagators are expressed as the products of $\boldsymbol{K}$'s (or $\mathrm{bpz}\big(\widetilde{\boldsymbol{K}}\big)$'s) and $\boldsymbol{Q}$. The concrete forms of $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$, which can be immediately obtained from $\boldsymbol{P}$ and $\widetilde{\boldsymbol{P}}$ in appendix D, are listed in appendix E.

We would like to mention some important properties of $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$ needed in the next section, in the form of a proposition. Let us define $\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{0,1}}$ and $\boldsymbol{Q}_{\boldsymbol{1,0}}$ as

$$\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{0,1}} := \mathrm{bpz}\Big(\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{1,0}}\Big)\ , \tag{4.36}$$

$$\boldsymbol{Q}_{\boldsymbol{1,0}} := +\mathrm{bpz}(\boldsymbol{Q}_{\boldsymbol{0,1}}) = \boldsymbol{Q}_{\boldsymbol{0,1}} = \mathrm{i}\,Q\eta_0\,. \tag{4.37}$$

Proposition 4.5 (Properties of $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$) *The following equations hold.*

$$\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}}\,\mathrm{bpz}\Big(\widetilde{\boldsymbol{B}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}}\Big) = 0 \quad (n\geq 1)\,, \quad \widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}\,\mathrm{bpz}\Big(\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2,n+1}}\Big) = 0 \quad (n\geq 0)\,, \tag{4.38}$$

$$\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}}\,\boldsymbol{Q}_{\boldsymbol{n,n+1}} = \boldsymbol{1_{n+1}} + \boldsymbol{M}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n+2}}\boldsymbol{B}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+2,n+1}} \quad (n\geq 0)\,, \tag{4.39}$$

$$\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}\,\boldsymbol{Q}_{\boldsymbol{n+1,n}} = \boldsymbol{1_n} + \widetilde{\boldsymbol{M}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}\widetilde{\boldsymbol{B}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}} \quad (n\geq 1)\ , \tag{4.40}$$

$$\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}} = \mathrm{bpz}\Big(\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}}\Big)\ , \quad \boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1,n}} = \mathrm{bpz}\Big(\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n,n+1}}\Big) \quad (n\geq 0)\,, \tag{4.41}$$

$$\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n},\boldsymbol{n-1}}\,\boldsymbol{Q}_{\boldsymbol{n-1},\boldsymbol{n}} + \boldsymbol{Q}_{\boldsymbol{n},\boldsymbol{n+1}}\,\boldsymbol{K}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n+1},\boldsymbol{n}} = \boldsymbol{1}_{\boldsymbol{n}} \quad (n \geq 1)\,, \tag{4.42}$$

$$\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n},\boldsymbol{n+1}}\,\boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n}} + \boldsymbol{Q}_{\boldsymbol{n},\boldsymbol{n-1}}\,\widetilde{\boldsymbol{K}}^{\zeta_0;\boldsymbol{x},\boldsymbol{y}}_{\boldsymbol{n-1},\boldsymbol{n}} = \boldsymbol{1}_{\boldsymbol{n}} \quad (n \geq 1)\,. \tag{4.43}$$

Eq. (4.38) immediately follows from the definition (4.35) and eqs. (3.8) and (3.9). Eqs. (4.39) and (4.40) are identically the relations (4.22) and (4.33). Eqs. (4.41), (4.42), and (4.43) can be confirmed with straightforward calculation. (Note that because eqs. (4.42) and (4.43) are the BPZ conjugates of each other, one does not have to confirm both.) We would like to stress that proposition 4.5 holds for *each* n, with x, y, and ζ_0 arbitrary (see also footnote 15).

5 Propagators

In order to find the propagators under the gauge-fixing conditions (3.1), we rewrite the action (2.51) as[17]

$$S = -\frac{1}{2}\big\langle \boldsymbol{\Phi_0}, \boldsymbol{Q_{0,1}}\boldsymbol{\Phi_0}\big\rangle - \frac{1}{2}\sum_{n=1}^{\infty}\left\langle \begin{bmatrix} \boldsymbol{\Phi}_{\boldsymbol{-n}} \\ \boldsymbol{\Phi}_{\boldsymbol{n+1}} \end{bmatrix}, \begin{bmatrix} \boldsymbol{0}_{\boldsymbol{n+1},\boldsymbol{n+1}} & \boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n}} \\ \boldsymbol{Q}_{\boldsymbol{n},\boldsymbol{n+1}} & \boldsymbol{0}_{\boldsymbol{n},\boldsymbol{n}} \end{bmatrix} \begin{bmatrix} \boldsymbol{\Phi}_{\boldsymbol{-n}} \\ \boldsymbol{\Phi}_{\boldsymbol{n+1}} \end{bmatrix} \right\rangle, \tag{5.1}$$

and consider the inverses of $\boldsymbol{Q_{0,1}} = \mathrm{i}\,Q\eta_0$ and $\begin{bmatrix} \boldsymbol{0}_{\boldsymbol{n+1},\boldsymbol{n+1}} & \boldsymbol{Q}_{\boldsymbol{n+1},\boldsymbol{n}} \\ \boldsymbol{Q}_{\boldsymbol{n},\boldsymbol{n+1}} & \boldsymbol{0}_{\boldsymbol{n},\boldsymbol{n}} \end{bmatrix}$ in the restricted subspaces

$$\mathrm{RS}^{\zeta}_{0} := \left\{ \boldsymbol{\Phi_0} \;\middle|\; \boldsymbol{B}^{\zeta_0^{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}_{\boldsymbol{2},\boldsymbol{1}}\boldsymbol{\Phi_0} = 0 \right\}, \tag{5.2a}$$

$$\mathrm{RS}^{\zeta}_{n} := \left\{ \begin{bmatrix} \boldsymbol{\Phi}_{\boldsymbol{-n}} \\ \boldsymbol{\Phi}_{\boldsymbol{n+1}} \end{bmatrix} \;\middle|\; \boldsymbol{B}^{\zeta_0^{(n)};\boldsymbol{x_n},\boldsymbol{y_n}}_{\boldsymbol{n+2},\boldsymbol{n+1}}\boldsymbol{\Phi}_{\boldsymbol{-n}} = 0\,,\quad \widetilde{\boldsymbol{B}}^{\zeta_0^{(n-1)};\boldsymbol{x_{n-1}},\boldsymbol{y_{n-1}}}_{\boldsymbol{n+1},\boldsymbol{n}}\boldsymbol{\Phi}_{\boldsymbol{n+1}} = 0 \right\} \quad (n \geq 1)\,. \tag{5.2b}$$

5.1 $\boldsymbol{\Phi_0}$-propagator

We denote the $\boldsymbol{\Phi_0}$-propagator by $\boldsymbol{\Delta_{1,0}}$. It is the inverse of $\boldsymbol{Q_{0,1}} = \mathrm{i}\,Q\eta_0$ in the subspace RS^{ζ}_{0}, where the equation

$$\boldsymbol{B}^{\zeta_0^{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}_{\boldsymbol{2},\boldsymbol{1}}\boldsymbol{\Phi_0} = 0 \qquad \left(\Longleftrightarrow\ \mathrm{bpz}(\boldsymbol{\Phi_0})\,\mathrm{bpz}\Big(\boldsymbol{B}^{\zeta_0^{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}_{\boldsymbol{2},\boldsymbol{1}}\Big) = 0\right) \tag{5.3}$$

holds. Thus, it has to satisfy the following relations:

$$\boldsymbol{\Delta_{1,0}}\boldsymbol{Q_{0,1}} = 1 + \boldsymbol{\mathcal{M}_{1,2}}\boldsymbol{B}^{\zeta_0^{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}_{\boldsymbol{2},\boldsymbol{1}}\,, \tag{5.4a}$$

$$\boldsymbol{Q_{0,1}}\boldsymbol{\Delta_{1,0}} = 1 + \mathrm{bpz}\Big(\boldsymbol{B}^{\zeta_0^{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}_{\boldsymbol{2},\boldsymbol{1}}\Big)\boldsymbol{\mathcal{M}_{2,1}} \tag{5.4b}$$

with $\boldsymbol{\mathcal{M}_{1,2}}$ and $\boldsymbol{\mathcal{M}_{2,1}}$ being some 1×2 matrix and some 2×1 matrix, respectively. Eq. (5.4a)/(5.4b) ensures that $\boldsymbol{\Delta_{1,0}}$ is the left/right inverse of $\boldsymbol{Q_{0,1}}$ in RS^{ζ}_{0}: the operator (5.4a)/(5.4b) acts as the identity operator upon $\boldsymbol{\Phi}_{\mathbf{0}}/\mathrm{bpz}(\boldsymbol{\Phi}_{\mathbf{0}})$ from the left/right under condition (5.3). It should be noted that if the propagator $\boldsymbol{\Delta}_{\mathbf{1,0}}$ is BPZ-even, eq. (5.4b) immediately follows from the BPZ conjugate of (5.4a).[18] As a matter of fact, we have already known the BPZ-even $\boldsymbol{\Delta}_{\mathbf{1,0}}$ satisfying eq. (5.4a). From eqs. (4.39), (E.1a), and (E.9), we find that $\boldsymbol{\Delta}_{\mathbf{1,0}}$ is precisely $\boldsymbol{K}_{\mathbf{1,0}}^{\zeta_0^{(0)};x_0,y_0}$:

---

[17] When we would like to explicitly show the size $m \times n$ of a zero matrix, we will append the subscript "m, n" and will denote the zero matrix by $\boldsymbol{0}_{\boldsymbol{m},\boldsymbol{n}}$.

$$\boldsymbol{\Delta}_{\mathbf{1,0}} = \boldsymbol{K}_{\mathbf{1,0}}^{\zeta_0^{(0)};x_0,y_0} = \boldsymbol{P}_{1,1}^{\zeta_0^{(0)};x_0,y_0}\,\boldsymbol{B}_{\mathbf{1,0}}^{\zeta_0^{(0)};x_0,y_0}\,. \tag{5.5}$$

5.2 Ghost propagators

Let us calculate the propagator $\boldsymbol{\Delta}_{n+1,n}$ between $\boldsymbol{\Phi}_{-n}$ and $\boldsymbol{\Phi}_{n+1}$ ($n \geq 1$) under the conditions (3.1). For this purpose, we consider the *BPZ-even* inverse of the matrix

$$\begin{bmatrix} \mathbf{0}_{n+1,n+1} & \boldsymbol{Q}_{n+1,n} \\ \boldsymbol{Q}_{n,n+1} & \mathbf{0}_{n,n} \end{bmatrix} = \begin{bmatrix} \mathbf{0}_{n+1,n+1} & \boldsymbol{Q}_{n+1,n} \\ -\mathrm{bpz}(\boldsymbol{Q}_{n+1,n}) & \mathbf{0}_{n,n} \end{bmatrix}. \tag{5.6}$$

We may suppose that it takes the form[19]

$$\begin{bmatrix} \mathbf{0}_{n+1,n+1} & \boldsymbol{\Delta}_{n+1,n} \\ \mathrm{bpz}(\boldsymbol{\Delta}_{n+1,n}) & \mathbf{0}_{n,n} \end{bmatrix}. \tag{5.7}$$

Because the matrix (5.7) is BPZ-even, if it is the left inverse of (5.6), it is automatically the right inverse. The propagator $\boldsymbol{\Delta}_{n+1,n}$ is obtained by solving the equation

$$\begin{aligned} &\begin{bmatrix} \mathbf{0}_{n+1,n+1} & \boldsymbol{\Delta}_{n+1,n} \\ \mathrm{bpz}(\boldsymbol{\Delta}_{n+1,n}) & \mathbf{0}_{n,n} \end{bmatrix} \begin{bmatrix} \mathbf{0}_{n+1,n+1} & \boldsymbol{Q}_{n+1,n} \\ \boldsymbol{Q}_{n,n+1} & \mathbf{0}_{n,n} \end{bmatrix} \\ &= \mathbf{1}_{2n+1} + \begin{bmatrix} \boldsymbol{\mathcal{M}}_{n+1,n+2}\boldsymbol{B}_{n+2,n+1}^{\zeta_0^{(n)};x_n,y_n} & \mathbf{0}_{n+1,n} \\ \mathbf{0}_{n,n+1} & \widetilde{\boldsymbol{\mathcal{M}}}_{n,n+1}\widetilde{\boldsymbol{B}}_{n+1,n}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}} \end{bmatrix} \quad (n \geq 1)\,. \end{aligned} \tag{5.8}$$

Here $\boldsymbol{\mathcal{M}}_{n+1,n+2}$ and $\widetilde{\boldsymbol{\mathcal{M}}}_{n,n+1}$ are some $(n+1)\times(n+2)$ matrix and some $n\times(n+1)$ matrix, respectively. Note that the right-hand side of eq. (5.8) acts as the identity $\mathbf{1}_{2n+1}$ in RS_n^{ζ}. The following proposition tells us the form of the propagator.

Proposition 5.1 (Ghost propagators) *Eq.* (5.8) *is solved by*

$$\begin{aligned} \boldsymbol{\Delta}_{n+1,n} &= \boldsymbol{K}_{n+1,n}^{\zeta_0^{(n)};x_n,y_n}\boldsymbol{Q}_{n,n+1}\boldsymbol{K}_{n+1,n}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}} \\ &= \big(\boldsymbol{P}_{n+1,n+1}^{\zeta_0^{(n)};x_n,y_n}\boldsymbol{B}_{n+1,n}^{\zeta_0^{(n)};x_n,y_n}\big)\boldsymbol{Q}_{n,n+1}\big(\boldsymbol{P}_{n+1,n+1}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}\boldsymbol{B}_{n+1,n}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}\big)\,. \end{aligned} \tag{5.9}$$

---

[18] In this case, the matrices $\boldsymbol{\mathcal{M}}_{\mathbf{1,2}}$ and $\boldsymbol{\mathcal{M}}_{\mathbf{2,1}}$ shall be related to each other.

[19] The propagator matrices in ref. [18] correspond to not $\boldsymbol{\Delta}_{n+1,n}$ but $\boldsymbol{\Delta}_{n,n+1} := \mathrm{bpz}(\boldsymbol{\Delta}_{n+1,n})$.

Proof. Eq. (5.8) is equivalent to the following set of equations:

$$\boldsymbol{\Delta}_{n+1,n}\boldsymbol{Q}_{n,n+1} = \boldsymbol{1}_{n+1} + \boldsymbol{\mathcal{M}}_{n+1,n+2}\boldsymbol{B}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1}\,, \tag{5.10a}$$

$$\mathrm{bpz}(\boldsymbol{\Delta}_{n+1,n})\,\boldsymbol{Q}_{n+1,n} = \boldsymbol{1}_n + \widetilde{\boldsymbol{\mathcal{M}}}_{n,n+1}\widetilde{\boldsymbol{B}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n+1,n}\,. \tag{5.10b}$$

Let us prove that (5.9) is the solution to these. For this purpose, we use proposition 4.5. From eqs. (4.42) and (4.43), and

$$\boldsymbol{Q}_{n-1,n}\,\boldsymbol{Q}_{n,n+1} = 0\,,\quad \boldsymbol{Q}_{n+1,n}\,\boldsymbol{Q}_{n,n-1} = 0\quad (n \geq 1)\,, \tag{5.11}$$

it follows that

$$\boldsymbol{Q}_{n,n+1}\boldsymbol{K}^{\zeta_0;x,y}_{n+1,n}\,\boldsymbol{Q}_{n,n+1} = \boldsymbol{Q}_{n,n+1}\quad (n \geq 1)\,, \tag{5.12}$$

$$\boldsymbol{Q}_{n+1,n}\widetilde{\boldsymbol{K}}^{\zeta_0;x,y}_{n,n+1}\,\boldsymbol{Q}_{n+1,n} = \boldsymbol{Q}_{n+1,n}\quad (n \geq 1)\,. \tag{5.13}$$

Thus we gain the equations below:

$$\begin{aligned}
&\Big(\boldsymbol{K}^{\zeta_0^{(n)};x_n,y_n}_{n+1,n}\boldsymbol{Q}_{n,n+1}\boldsymbol{K}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n+1,n}\Big)\boldsymbol{Q}_{n,n+1}\\
&= \boldsymbol{K}^{\zeta_0^{(n)};x_n,y_n}_{n+1,n}\Big(\boldsymbol{Q}_{n,n+1}\boldsymbol{K}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n+1,n}\boldsymbol{Q}_{n,n+1}\Big)\\
&= \boldsymbol{K}^{\zeta_0^{(n)};x_n,y_n}_{n+1,n}\boldsymbol{Q}_{n,n+1} = \boldsymbol{1}_{n+1} + \boldsymbol{M}^{\zeta_0^{(n)};x_n,y_n}_{n+1,n+2}\,\boldsymbol{B}^{\zeta_0^{(n)};x_n,y_n}_{n+2,n+1}\qquad (n \geq 1)\,,
\end{aligned} \tag{5.14}$$

$$\begin{aligned}
&\mathrm{bpz}\Big(\boldsymbol{K}^{\zeta_0^{(n)};x_n,y_n}_{n+1,n}\boldsymbol{Q}_{n,n+1}\boldsymbol{K}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n+1,n}\Big)\boldsymbol{Q}_{n+1,n}\\
&= \Big(\widetilde{\boldsymbol{K}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n,n+1}\boldsymbol{Q}_{n+1,n}\widetilde{\boldsymbol{K}}^{\zeta_0^{(n)};x_n,y_n}_{n,n+1}\Big)\boldsymbol{Q}_{n+1,n}\\
&= \widetilde{\boldsymbol{K}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n,n+1}\Big(\boldsymbol{Q}_{n+1,n}\widetilde{\boldsymbol{K}}^{\zeta_0^{(n)};x_n,y_n}_{n,n+1}\boldsymbol{Q}_{n+1,n}\Big)\\
&= \widetilde{\boldsymbol{K}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n,n+1}\boldsymbol{Q}_{n+1,n} = \boldsymbol{1}_n + \widetilde{\boldsymbol{M}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n,n+1}\widetilde{\boldsymbol{B}}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}}_{n+1,n}\qquad (n \geq 1)\,.
\end{aligned} \tag{5.15}$$

In the second and the last equality of (5.14), we have used eqs. (5.12) and (4.39), respectively, and in the first, the third, and the last equality of (5.15), we have used eqs. (4.41), (5.13), and (4.40), respectively. Eqs. (5.14) and (5.15) ensure that eq. (5.10) is solved by (5.9). □

As was mentioned in section 4.1, the propagator (5.9) has poles at the points where $L_0 = 0$, $L_{x_{n-1},y_{n-1}} = 0$, or $L_{x_n,y_n} = 0$ because $\boldsymbol{K}$'s have. We would like to remark that *all the information about gauge-fixing conditions is incorporated into the propagator through the matrix* $\boldsymbol{K} = \mathrm{bpz}\big(\widetilde{\boldsymbol{K}}\big)$ (recall the definition (4.35)). As is shown in the corollary below, the expression (5.9) is simplified in the special case in which

$$\zeta_0^{(n-1)} = \zeta_0^{(n)}\,(=\zeta_0)\,,\quad x_{n-1} = x_n\,(=x)\,,\quad y_{n-1} = y_n\,(=y)\,. \tag{5.16}$$

Corollary 5.2 *Under condition* (5.16), *the propagator* (5.9) *is simplified to*

$$\boldsymbol{\Delta}_{\boldsymbol{n+1,n}} = \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} = \boldsymbol{P}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n+1}} \boldsymbol{B}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \,. \tag{5.17}$$

Proof. From eqs. (4.41), (4.35), and (4.38), we obtain

$$\begin{aligned} &\boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} = \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \,\mathrm{bpz}\Big(\widetilde{\boldsymbol{K}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+1}}\Big) = \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \,\mathrm{bpz}\Big(\widetilde{\boldsymbol{P}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+2}} \widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}}\Big) \\ &= \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \,\mathrm{bpz}\Big(\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}}\Big) \,\mathrm{bpz}\Big(\widetilde{\boldsymbol{P}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+2}}\Big) = 0 \qquad (n \geq 1) \,. \end{aligned} \tag{5.18}$$

Thus, using eqs. (5.18) and (4.42), we find that

$$\begin{aligned} \boldsymbol{\Delta}_{\boldsymbol{n+1,n}} &= \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \boldsymbol{Q}_{\boldsymbol{n,n+1}} \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \\ &= \Big(\boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \boldsymbol{Q}_{\boldsymbol{n,n+1}} + \boldsymbol{Q}_{\boldsymbol{n+1,n+2}} \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}}\Big) \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} = \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \,. \end{aligned} \tag{5.19}$$

□

5.3 Some examples

In the present subsection, let us see some examples in which the propagators become simple. We focus on gauge-fixing conditions such that

$$\zeta_0^{(n)} = \zeta_0 \,, \quad x_n = x \,, \quad y_n = y \qquad (\text{for every } n) \,. \tag{5.20}$$

In this case, according to corollary 5.2, propagators are given by

$$\boldsymbol{\Delta}_{\boldsymbol{n+1,n}} = \boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \qquad (\forall n \geq 0) \,. \tag{5.21}$$

For the concrete forms of the matrices $\boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}}$, see appendix E.

(I) $\boldsymbol{\zeta_0 = \xi_0}$ case

For $\zeta_0 = \xi_0$, propagators take complicated forms because $\{Q, \xi_0\}$ is non-vanishing. However, they are dramatically simplified when $x = 0$ or $y = 0$.

(i) $\boldsymbol{x = 0}$ (and $\boldsymbol{y \neq 0}$) case

When x is zero, operators composing the matrices $\boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n+1,n}}$ listed in appendix E are reduced to

$$P_\xi = \xi_0 \eta_0 \,, \quad P_X = -X_0 \,, \quad \frac{K_\xi}{L_{x,y}} = \xi_0 \,, \quad K_{Xb} = \xi_0 \Big(1 - \frac{X_0 \eta_0 b_0}{L_0}\Big) , \tag{5.22}$$

where $X_0 := \{Q, \xi_0\}$ is the zero mode of the picture-changing operator $X(z) = \{Q, \xi(z)\}$. Thus we obtain

$$\boldsymbol{\Delta}_{\boldsymbol{1,0}} = \mathrm{i}\, \frac{b_0 \xi_0}{L_0} \,, \quad \boldsymbol{\Delta}_{\boldsymbol{2,1}} = \begin{bmatrix} \frac{\xi_0 \eta_0 b_0}{L_0} \\ \xi_0 \big(1 - \frac{X_0 \eta_0 b_0}{L_0}\big) \end{bmatrix} =: \begin{bmatrix} E \\ F \end{bmatrix} , \tag{5.23a}$$

$$\boldsymbol{\Delta}_{\mathbf{3,2}} = \begin{bmatrix} E & 0 \\ F & 0 \\ (-X_0)F & \xi_0 \end{bmatrix}, \quad \boldsymbol{\Delta}_{\mathbf{4,3}} = \begin{bmatrix} E & 0 & 0 \\ F & 0 & 0 \\ (-X_0)F & \xi_0 & 0 \\ (-X_0)^2F & (-X_0)\xi_0 & \xi_0 \end{bmatrix}, \tag{5.23b}$$

$$\boldsymbol{\Delta}_{\boldsymbol{n+1,n}} = \begin{bmatrix} E & 0 & 0 & 0 & \cdots & 0 & 0 \\ F & 0 & 0 & 0 & \cdots & 0 & 0 \\ (-X_0)F & \xi_0 & 0 & 0 & \cdots & 0 & 0 \\ (-X_0)^2F & (-X_0)\xi_0 & \xi_0 & 0 & \cdots & 0 & 0 \\ (-X_0)^3F & (-X_0)^2\xi_0 & (-X_0)\xi_0 & \xi_0 & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ (-X_0)^{n-2}F & (-X_0)^{n-3}\xi_0 & (-X_0)^{n-4}\xi_0 & (-X_0)^{n-5}\xi_0 & \cdots & \xi_0 & 0 \\ (-X_0)^{n-1}F & (-X_0)^{n-2}\xi_0 & (-X_0)^{n-3}\xi_0 & (-X_0)^{n-4}\xi_0 & \cdots & (-X_0)\xi_0 & \xi_0 \end{bmatrix} \quad (n \geq 1)\,. \tag{5.24}$$

It is noteworthy that the propagators include X_0. We would like to remark that the propagator matrices in ref. [18] correspond to the BPZ conjugates $\boldsymbol{\Delta}_{\boldsymbol{n,n+1}} := \mathrm{bpz}(\boldsymbol{\Delta}_{\boldsymbol{n+1,n}})$ rather than $\boldsymbol{\Delta}_{\boldsymbol{n+1,n}}$ themselves. In order to help ones's understanding, we list $\boldsymbol{\Delta}_{\boldsymbol{n,n+1}}$ as well.

$$\boldsymbol{\Delta}_{\mathbf{0,1}} = \mathrm{i}\,\frac{b_0\xi_0}{L_0}\,, \quad \boldsymbol{\Delta}_{\mathbf{1,2}} = \begin{bmatrix} \frac{\eta_0\xi_0 b_0}{L_0} & (1 + \frac{X_0\eta_0 b_0}{L_0})\xi_0 \end{bmatrix} = \begin{bmatrix} E^\star & F^\star \end{bmatrix}, \tag{5.25a}$$

$$\boldsymbol{\Delta}_{\mathbf{2,3}} = \left[\begin{array}{ccc} E^\star & F^\star & (-X_0)F^\star \\ \hline 0 & 0 & \xi_0 \end{array}\right], \quad \boldsymbol{\Delta}_{\mathbf{3,4}} = \left[\begin{array}{cccc} E^\star & F^\star & (-X_0)F^\star & (-X_0)^2F^\star \\ \hline 0 & 0 & \xi_0 & (-X_0)\xi_0 \\ 0 & 0 & 0 & \xi_0 \end{array}\right], \tag{5.25b}$$

$$\boldsymbol{\Delta}_{\boldsymbol{n,n+1}} = \left[\begin{array}{cccccccc} E^\star & F^\star & (-X_0)F^\star & (-X_0)^2F^\star & \cdots & (-X_0)^{n-2}F^\star & (-X_0)^{n-1}F^\star \\ \hline 0 & 0 & \xi_0 & (-X_0)\xi_0 & \cdots & (-X_0)^{n-3}\xi_0 & (-X_0)^{n-2}\xi_0 \\ 0 & 0 & 0 & \xi_0 & \cdots & (-X_0)^{n-4}\xi_0 & (-X_0)^{n-3}\xi_0 \\ \vdots & \vdots & \vdots & \vdots & \cdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & \cdots & \xi_0 & (-X_0)\xi_0 \\ 0 & 0 & 0 & 0 & \cdots & 0 & \xi_0 \end{array}\right] \quad (n \geq 1)\,, \tag{5.26}$$

where $\star$ denotes the BPZ conjugation.

(ii) $y = 0$ (and $x \neq 0$) case

When y is zero, we have

$$P_\xi = 1\,, \quad P_X = \frac{K_\xi}{L_{x,y}} = K_{Xb} = 0\,, \tag{5.27}$$

so that propagators are given by

$$\boldsymbol{\Delta_{1,0}} = \mathrm{i}\,\frac{b_0\xi_0}{L_0}\,, \quad \boldsymbol{\Delta_{2,1}} = \begin{bmatrix} \frac{b_0}{L_0} \\ \frac{\xi_0 b_0 Q}{L_0} \end{bmatrix}, \quad \boldsymbol{\Delta_{3,2}} = \begin{bmatrix} \frac{b_0}{L_0} & 0 \\ 0 & \frac{b_0}{L_0} \\ 0 & \frac{\xi_0 b_0 Q}{L_0} \end{bmatrix}, \tag{5.28}$$

$$\boldsymbol{\Delta_{n+1,n}} = \begin{bmatrix} \frac{b_0}{L_0} & & & & \text{\Large 0} \\ & \frac{b_0}{L_0} & & & \\ & & \ddots & & \\ & & & \frac{b_0}{L_0} & \\ & & & & \frac{b_0}{L_0} \\ \text{\Large 0} & & & & \frac{\xi_0 b_0 Q}{L_0} \end{bmatrix} \qquad (n \geq 1)\,. \tag{5.29}$$

(II) $\zeta_0 = d_0$ case (with general x and y)

In the $\zeta_0 = d_0$ case, unlike in the $\zeta_0 = \xi_0$ case, propagators take simple forms for general x and y (with $(x, y) \neq (0, 0)$ and $x + y \neq 0$). This is the reflection of the algebraic relations (2.72) symmetric in b_0 and d_0. It is crucial that the anticommutator $\{Q, \zeta_0\}$ vanishes for $\zeta_0 = d_0$. Small-size propagators are given by

$$\boldsymbol{\Delta_{1,0}} = \mathrm{i}\,\frac{b_0 d_0}{L_0^2}\,, \quad \boldsymbol{\Delta_{2,1}} = \begin{bmatrix} K_b \\ K_d \end{bmatrix}, \quad \boldsymbol{\Delta_{3,2}} = \begin{bmatrix} K_b & 0 \\ \frac{y d_0}{L_{x,y}} & \frac{x b_0}{L_{x,y}} \\ 0 & K_d \end{bmatrix}, \tag{5.30}$$

with

$$K_b := \frac{b_0}{L_0}\Big(1 - y\frac{\eta_0 d_0}{L_{x,y}}\Big), \quad K_d := \frac{d_0}{L_0}\Big(1 - x\frac{Q b_0}{L_{x,y}}\Big). \tag{5.31}$$

The symbol $L_{x,y}$ is defined in eq. (4.9). For an arbitrary $n\,(\geq 1)$, we have

$$\boldsymbol{\Delta_{n+1,n}} = \begin{bmatrix} K_b & & & & \text{\Large 0} \\ \frac{y d_0}{L_{x,y}} & \frac{x b_0}{L_{x,y}} & & & \\ & \frac{y d_0}{L_{x,y}} & \frac{x b_0}{L_{x,y}} & & \\ & & \ddots & \ddots & \\ & & & \frac{y d_0}{L_{x,y}} & \frac{x b_0}{L_{x,y}} \\ \text{\Large 0} & & & & K_d \end{bmatrix} \qquad (n \geq 1)\,. \tag{5.32}$$

It is worth while mentioning that in b_0-d_0 gauges, propagators involve the inverse of L_0^2 (see, for example, the form of $\boldsymbol{\Delta_{1,0}}$). Since L_0 corresponds to $p^2 + m^2$ in field theory of particles, the existence of $1/L_0^2$ seems to imply the appearance of $(p^2 + m^2)^{-2}$ in the propagators. One may think that this is problematic, but in ref. [30], it is shown that the correct on-shell four-point tree amplitude is reproduced by using the propagator $\boldsymbol{\Delta_{1,0}}$. We will discuss more about b_0-d_0 gauges in section 7.

6 Extension similar to linear b-gauges

Thus far, we have been dealing with a simple class of gauge-fixing conditions. Gauge-fixing matrices were composed of only the zero modes b_0 and ζ_0. In this sense, condition (3.1) is analogous to the Siegel gauge [26] in cubic string field theory [4, 9], under which string fields are annihilated by b_0. In fact, as is shown in ref. [18], the gauge-fixed action in the b_0-ξ_0 gauge with $x = 0$ corresponds to that in the Siegel gauge in Witten's superstring field theory [9].[20] The form of the propagator (5.9) tells us that the gauges are suitable to see the relation to the world-sheet theory on the upper half-plane: on-shell poles can be specified in terms of L_0.

However, recent analytic methods in open string field theory have been developing in another conformal frame, the sliver frame [31], in which computations involving Witten's star product [4] are facilitated. This series of developments was triggered by Schnabl's analysis [7] of the tachyon vacuum in bosonic string field theory [4]. He utilized a gauge naturally fitting into the above-mentioned frame, which was crucial to the classical solution describing the tachyon condensation. Although the Schnabl gauge itself turned out to be singular [32], Kiermaier, Sen, and Zwiebach have shown that it can be realized as a limit of a one-parameter family of regular gauges [24]. Their gauge-fixing conditions were constructed from linear combinations of b-ghost oscillators, after which they were named "linear b-gauges."

In the present section, we consider the extension of the conditions (3.1) in this direction. First, in section 6.1, we review linear b-gauges in bosonic string field theory. We explain the subject in detail because our analysis in the case of the superstring field theory is based on the same argument. Second, in section 6.2, we propose extended gauge-fixing conditions in which b_0's and ζ_0's in condition (3.1) are replaced with linear combinations of b-modes and of ζ-modes, respectively. Lastly, in section 6.3, we consider the propagators under the extended gauge-fixing conditions.

6.1 Linear b-gauges in bosonic string field theory

6.1.1 The extended action and gauge-fixing conditions

The free bosonic string field theory action [4] takes the form

$$S_0 = -\frac{1}{2}\langle \Psi_1, Q\Psi_1\rangle \,, \tag{6.1}$$

where Ψ_1 is a Grassmann-odd string field of world-sheet ghost number one. In what follows, the world-sheet ghost number g of a bosonic string field is indicated by a subscript as in Ψ_g. Owing to the ghost number anomaly, BPZ inner products of the form $\langle \Psi_{g_1}, \Psi_{g_2}\rangle$ vanish unless $g_1 + g_2 = 3$. Note that in eq. (6.1), unlike in eq. (2.1), Q denotes the BRST operator for bosonic strings.

---

[20] Note that as long as one restricts oneself within the free theory, no problem exists in Witten's superstring field theory.

As is well-known, the extended action S in this theory is given by [33, 34, 35, 36, 37]

$$S = -\frac{1}{2}\langle \Psi, Q\Psi \rangle = -\frac{1}{2}\langle \Psi_1, Q\Psi_1 \rangle - \sum_{g\le 0} \langle \Psi_{2-g}, Q\Psi_g \rangle \,. \tag{6.2}$$

Here the symbol

$$\Psi := \sum_{g=-\infty}^{\infty} \Psi_g \tag{6.3}$$

is the sum of the original field Ψ_1, all the ghosts Ψ_g $(g \le 0)$, and all the antighosts Ψ_g $(g \ge 2)$. Every string field on the right-hand side of eq. (6.3) is Grassmann odd. The action (6.2) is invariant under the following gauge transformations:

$$\Psi_g \;\longrightarrow\; \Psi_g + Q\Lambda_{g-1} \quad (g \in \mathbb{Z})\,. \tag{6.4}$$

In order to fix the gauges, we impose on each string field a condition of the form

$$\mathcal{B}_{(g)}\Psi_g = 0 \quad (g \in \mathbb{Z})\,, \tag{6.5}$$

where $\mathcal{B}_{(g)}$ is some Grassmann-odd nilpotent operator of world-sheet ghost number minus one. We have specified by the subscript (g) that $\mathcal{B}_{(g)}$ acts upon Ψ_g. BRST-invariant gauge-fixed actions can be constructed in the same manner that was explained in section 2.2. We impose the conditions on antighosts Ψ_g $(g \ge 2)$ directly, whereas those on Ψ_1 and ghosts Ψ_g $(g \le 0)$ are achieved indirectly by introducing the gauge-fixing term

$$S^{\mathrm{GF}} = -\sum_{g\le 1} \langle N_{4-g}, \mathcal{B}_{(g)}\Psi_g \rangle = \sum_{g\le 1} \langle \mathcal{B}^{\star}_{(g)} N_{4-g}, \Psi_g \rangle \,. \tag{6.6}$$

Here N_{4-g} are Grassmann-odd auxiliary fields, and $\star$ denotes the BPZ conjugation. Needless to say, in order to remove the redundant symmetries (Θ's are parameters)

$$N_{4-g} \;\longrightarrow\; N_{4-g} + \mathcal{B}^{\star}_{(g)}\Theta_{5-g} \quad (g \le 1)\,, \tag{6.7}$$

one has to restrict the space of N's; however, we do not specify the restrictions. The completely gauge-fixed action

$$S + S^{\mathrm{GF}} = -\frac{1}{2}\langle \Psi_1, Q\Psi_1 \rangle - \sum_{g\le 0} \langle \Psi_{2-g}, Q\Psi_g \rangle + \sum_{g\le 1} \langle \mathcal{B}^{\star}_{(g)} N_{4-g}, \Psi_g \rangle \tag{6.8}$$

is invariant under the BRST transformation of the form

$$\delta_B \Psi_g = Q\Psi_{g-1} \quad (g \le 1)\,, \tag{6.9a}$$

$$\delta_B \Psi_g = \mathcal{B}^{\star}_{(3-g)} N_{g+1} \quad (g \ge 2)\,, \tag{6.9b}$$

$$\delta_B N_g = 0 \quad (g \ge 3)\,. \tag{6.9c}$$

We would like to remark that the expression (6.8) can be rewritten as

$$S + S^{\mathrm{GF}} = -\frac{1}{2}\langle \Psi_1, Q\Psi_1 \rangle + \delta_B \sum_{g\leq 0} \langle \Psi_{2-g}, \Psi_{g+1} \rangle \ . \tag{6.10}$$

This time, compatibility between the constraints on and the BRST transformations of antighosts requires

$$\mathcal{B}_{(g)} \mathcal{B}^{\star}_{(3-g)} = 0 \quad (g \geq 2)\,, \tag{6.11}$$

which implies

$$\mathcal{B}_{(g)} = \mathcal{B}^{\star}_{(3-g)} \quad (g \geq 2)\,. \tag{6.12}$$

Thus, if $\mathcal{B}_{(g)}$ with $g \leq 1$ are given, then the other $\mathcal{B}$'s are automatically determined.

In ref. [24], a class of gauges fulfilling the requirements (6.12) is explored. There, $\mathcal{B}$'s are composed of linear combinations of b-modes, weighted by vector fields $v^{(g)}(z)$:

$$\mathcal{B}_{(g)} = \sum_{k=-\infty}^{\infty} v^{(g)}_k\, b_k = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, v^{(g)}(z) b(z) \quad (g \leq 1) \quad \text{with} \quad v^{(g)}(z) = \sum_{k=-\infty}^{\infty} v^{(g)}_k z^{k+1}\,. \tag{6.13}$$

Here C_1 denotes the counterclockwise unit circle centered at the origin. We have assumed that the Laurent expansions of $v^{(g)}(z)$ are valid on C_1. In order for these linear b-gauges to be physically reasonable, $v^{(g)}$ have to obey some restraints explained below.

(i) Compatibility with the reality condition

In order to guarantee the reality of the open string field theory action, one has to impose a certain condition on each string field [38]. It requires that string fields Ψ_g be invariant under the composition of Hermitian conjugation (hc) and the inverse BPZ conjugation (bpz^{-1}):[21]

$$\Psi^{\ddagger}_g := \mathrm{bpz}^{-1} \circ \mathrm{hc}\,(\Psi_g) = \Psi_g \quad (g \in \mathbb{Z})\,. \tag{6.14}$$

Under these constraints, eq. (6.5) implies

$$\big(\mathcal{B}_{(g)}\Psi_g\big)^{\ddagger} = 0\,, \quad \text{i.e.,} \quad \mathcal{B}^{\ddagger}_{(g)}\Psi_g = 0 \quad (g \in \mathbb{Z})\,. \tag{6.15}$$

Thus, in order for the gauges (6.5) to be compatible with the reality condition, $\mathcal{B}$'s have to satisfy

$$\mathcal{B}^{\ddagger}_{(g)} = \alpha_{(g)}\, \mathcal{B}_{(g)} \iff \sum_{k=-\infty}^{\infty} \overline{v^{(g)}_k}\, (-1)^k b_k \,=\, \alpha_{(g)} \sum_{k=-\infty}^{\infty} v^{(g)}_k b_k \iff (-1)^k\, \overline{v^{(g)}_k} = \alpha_{(g)}\, v^{(g)}_k \ \ (\forall k \in \mathbb{Z}) \tag{6.16}$$

for some $\alpha_{(g)} \in \mathbb{C} \setminus \{0\}$. Here we have used

$$\mathrm{hc}(b_k) = b_{-k}\,, \quad \mathrm{bpz}(b_k) = (-1)^k b_{-k}\,, \tag{6.17}$$

---

[21] For pedagogical explanation of the reality condition, see appendix C of ref. [28].

and have denoted by $\overline{v_k^{(g)}}$ the complex conjugate of $v_k^{(g)}$. The last equation in (6.16) tells us that the absolute values of $\alpha_{(g)}$ are equal to one:

$$(-1)^k\,\overline{v_k^{(g)}} = \alpha_{(g)}\,v_k^{(g)} \quad (\forall k \in \mathbb{Z}) \implies |v_k^{(g)}| = |\alpha_{(g)}||v_k^{(g)}| \quad (\forall k \in \mathbb{Z}) \iff |\alpha_{(g)}| = 1\,. \tag{6.18}$$

(ii) Validity of the Riemann surface interpretation and the Schwinger representation

The equations of motion derived from the action (6.2) are of the form

$$Q\Psi_g = 0 \quad (g \in \mathbb{Z})\,. \tag{6.19}$$

From eqs. (6.5) and (6.19) it follows that

$$\mathcal{L}_{(g)}\Psi_g = \{Q, \mathcal{B}_{(g)}\}\Psi_g = 0 \quad \text{with} \quad \mathcal{L}_{(g)} := \{Q, \mathcal{B}_{(g)}\} \quad (g \in \mathbb{Z})\,. \tag{6.20}$$

Consequently, on the mass shell of Ψ_g, we have $\mathcal{L}_{(g)} = 0$, which implies that the propagator involves the inverse of $\mathcal{L}_{(g)}$.

In the case of the Siegel gauge, in which $\mathcal{B}_{(g)} = b_0$ ($\forall g \in \mathbb{Z}$) and thus $\mathcal{L}_{(g)} = L_0$, we may utilize the Schwinger representation

$$\frac{1}{L_0} = \lim_{\Lambda\to\infty}\int_0^\Lambda \mathrm{d}s\, \mathrm{e}^{-sL_0} \tag{6.21}$$

because for states of positive conformal weight, we have

$$L_0\int_0^\Lambda \mathrm{d}s\, \mathrm{e}^{-sL_0} = 1 - \mathrm{e}^{-\Lambda L_0} \to 1 \quad (\Lambda \to \infty)\,. \tag{6.22}$$

The merit of the above representation is that Feynman diagrams in string field theory can be naturally interpreted as correlation functions on Riemann surfaces, with insertions of the operators e^{-sL_0} providing parts of the surfaces. We would like to apply this interpretation also to the case of general linear b-gauges, in which we shall consider the operators

$$\mathcal{L}_{(g)} = \{Q, \mathcal{B}_{(g)}\} = \oint_{C_1}\frac{\mathrm{d}z}{2\pi\mathrm{i}}\,v^{(g)}(z)\,T(z) = \int_{C_s}\left(\frac{\mathrm{d}z}{2\pi\mathrm{i}}\,v^{(g)}(z)\,T(z) - \frac{\mathrm{d}\overline{z}}{2\pi\mathrm{i}}\,v^{(g)}(\overline{z})\,T(\overline{z})\right). \tag{6.23}$$

Here C_s denotes the origin-centered counterclockwise unit semicircle on the upper half-plane, and T denotes the energy-momentum tensor satisfying

$$\overline{T(z)} = T(\overline{z}) \tag{6.24}$$

with the bars representing complex conjugation.

First, in order that $\mathcal{L}_{(g)}$ may generate conformal transformations and thus insertions of the form $\mathrm{e}^{-s\mathcal{L}_{(g)}}$ may fit into the Riemann surface interpretation, the vector fields $v^{(g)}(z)$ have to satisfy the conditions corresponding to (6.24):

$$\overline{v^{(g)}(z)} = v^{(g)}(\overline{z})\,. \tag{6.25}$$

As a necessary result, all the coefficients $v_k^{(g)}$ are real, and we may assume $v_0^{(g)} \geq 0$ ($\forall g \leq 1$) without loss of generality. (If necessary, we can multiply some of the equations (6.5) by minus one.)

Second, in order for the Schwinger representation of $1/\mathcal{L}_{(g)}$ to be valid, the operator $\mathrm{e}^{-\Lambda_{(g)}\mathcal{L}_{(g)}}$ in

$$\mathcal{L}_{(g)} \int_0^{\Lambda_{(g)}} \mathrm{d}s\, \mathrm{e}^{-s\mathcal{L}_{(g)}} = 1 - \mathrm{e}^{-\Lambda_{(g)}\mathcal{L}_{(g)}} \tag{6.26}$$

has to vanish in the $\Lambda_{(g)} \to \infty$ limit. It is shown in ref. [24] that if the vector field $v^{(g)}$ obeying the constraints (6.16) and (6.25) is analytic in some neighborhood of the unit circle $|z| = 1$ and satisfies

$$v_\perp^{(g)}(z) := \Re\big[\overline{z}\, v^{(g)}(z)\big] > 0 \quad \text{for} \quad |z| = 1\,, \tag{6.27}$$

then the term $\mathrm{e}^{-\Lambda_{(g)}\mathcal{L}_{(g)}}$ vanishes in the $\Lambda_{(g)} \to \infty$ limit, and the representation

$$\frac{1}{\mathcal{L}_{(g)}} = \lim_{\Lambda_{(g)}\to\infty} \int_0^{\Lambda_{(g)}} \mathrm{d}s\, \mathrm{e}^{-s\mathcal{L}_{(g)}} \tag{6.28}$$

provides a proper definition of $1/\mathcal{L}_{(g)}$.[22] Substituting $z = \mathrm{e}^{\mathrm{i}\theta}$ ($\theta \in \mathbb{R}$) into eq. (6.27), we find that $v_0^{(g)}$ should be positive:

$$0 < \frac{1}{2\pi} \int_0^{2\pi} \mathrm{d}\theta\, v_\perp^{(g)}(\mathrm{e}^{\mathrm{i}\theta}) = \int_0^{2\pi} \mathrm{d}\theta \Big(v_0^{(g)} + \sum_{k\neq 0} v_k^{(g)} \cos(k\theta) \Big) = v_0^{(g)}\,. \tag{6.29}$$

Note that eq. (6.16) and the positivity of $v_0^{(g)} \in \mathbb{R}$ entail $\alpha_{(g)} = 1$, so that taking account of the reality of $v_k^{(g)}$, we obtain

$$v^{(g)}(z) = \sum_{k=-\infty}^{\infty} v_{2k}^{(g)} z^{2k+1}\,, \quad \text{i.e.,} \quad v^{(g)}(-z) = -v^{(g)}(z)\,. \tag{6.30}$$

In summary, we require that $v^{(g)}$ be analytic in some neighborhood of the unit circle $|z| = 1$ and satisfy conditions (6.25), (6.27), and (6.30):

$$\overline{v^{(g)}(z)} = v^{(g)}(\overline{z})\,, \quad v^{(g)}(-z) = -v^{(g)}(z)\,, \tag{6.31a}$$

$$v_\perp^{(g)}(z) := \Re\big[\overline{z}\, v^{(g)}(z)\big] > 0 \quad \text{for} \quad |z| = 1\,. \tag{6.31b}$$

These requirements are consistent with the constraints (6.12). To see this, we use the expression

$$\mathcal{B}_{(g)}^\star = \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}} \big(v^{(g)}\big)^\star(z) b(z) \quad \text{with} \quad \big(v^{(g)}\big)^\star(z) := -z^2 v^{(g)}(-1/z)\,. \tag{6.32}$$

It can be readily confirmed that $\big(v^{(g)}\big)^\star(z)$ fulfills condition (6.31a) if and only if $v^{(g)}(z)$ does. Furthermore, under condition (6.31a), we have

$$\overline{z}\,\big(v^{(g)}\big)^\star(z) = -z v^{(g)}(-1/z) = z v^{(g)}(1/z) = z v^{(g)}(\overline{z}) = \overline{\overline{z}\, v^{(g)}(z)} \quad \text{for} \quad |z| = 1\,. \tag{6.33}$$

---

[22] Condition (6.27) is *sufficient* but *may not be necessary.*

This equation, together with (6.31b), ensures that $\big(v^{(g)}\big)^\star(z)$ indeed obeys the condition corresponding to (6.31b):

$$\Re\big[\overline{z}\,\big(v^{(g)}\big)^\star(z)\big]=\Re\big[\overline{z}\,v^{(g)}(z)\big]>0 \quad \text{for} \quad |z|=1\,. \tag{6.34}$$

Here is an additional remark. The analyticity of $v^{(g)}$ in some neighborhood of the unit circle guarantees that each vector field $v^{(g)}(z)$ is analytic in some ring domain

$$R(r_{(g)},r'_{(g)}):=\Big\{\,z\in\mathbb{C}\,\Big|\,0<r_{(g)}<|z|<r'_{(g)}\Big\}\quad\big(r_{(g)}<1<r'_{(g)}\big), \tag{6.35}$$

and thus the Laurent expansion

$$v^{(g)}(z)=\sum_{k=-\infty}^{\infty}v^{(g)}_k\,z^{k+1} \tag{6.36}$$

is valid there. However, the same Laurent expansion cannot necessarily be utilized for $0<|z|<r_{(g)}$: the vector field may have some singularities.

In ref. [24], gauge-fixing conditions meeting the requirements (6.31) are said to be regular. The Siegel gauge, under which $v^{(g)}(z)=z$ ($\forall g\in\mathbb{Z}$), is obviously regular. However, as we shall see, the Schnabl gauge is not.

6.1.2 Regularization of the Schnabl gauge

The Schnabl gauge is characterized by the zero mode $\hat{b}_0$ of the b-ghost in the sliver frame [31]:

$$\hat{b}_0:=\oint_{C_1}\frac{\mathrm{d}\hat{z}}{2\pi\mathrm{i}}\,\hat{z}\,\hat{b}(\hat{z})\,,\quad \hat{z}:=f(z)=\frac{2}{\pi}\arctan(z)\,, \tag{6.37}$$

where

$$\hat{b}(\hat{z})=\left(\frac{\mathrm{d}\hat{z}}{\mathrm{d}z}\right)^{-2}b(z) \tag{6.38}$$

is the conformal transform of b by the function f. Expressing the integral (6.37) in terms of z, we obtain

$$\hat{b}_0=\oint_{C_1}\frac{\mathrm{d}z}{2\pi\mathrm{i}}\,\frac{f(z)}{f'(z)}\,b(z)=\oint_{C_1}\frac{\mathrm{d}z}{2\pi\mathrm{i}}\,(1+z^2)\arctan(z)\,b(z)\,. \tag{6.39}$$

Therefore, if we choose $\hat{b}_0$ as $\mathcal{B}_{(1)}$, then the corresponding vector field $v^{(1)}=\hat{v}$ takes the form

$$\hat{v}(z)=\frac{f(z)}{f'(z)}=(1+z^2)\arctan(z)\,, \tag{6.40}$$

whose non-vanishing coefficients are

$$\hat{v}_0=1\,,\quad \hat{v}_{2k}=\frac{2(-1)^{k+1}}{4k^2-1}\quad(k=1,2,\ldots)\,. \tag{6.41}$$

One should note that this gauge is *not* regular because it does not satisfy condition (6.31b) for $z=\pm\mathrm{i}$:

$$\hat{v}(\pm\mathrm{i})=\pm\mathrm{i}\Big(\hat{v}_0+\sum_{k=1}^{\infty}\hat{v}_{2k}(-1)^k\Big)=\pm\mathrm{i}\Big(1-\sum_{k=1}^{\infty}\frac{2}{4k^2-1}\Big)=0\,. \tag{6.42}$$

However, there exists a one-parameter family of regular gauges $\mathcal{B}_{(1)} = \hat{b}_0^\lambda$ with $0 < \lambda < \infty$ which realizes the Schnable gauge in the $\lambda \to 0$ limit:

$$\hat{b}_0^\lambda := \mathrm{e}^{\lambda L_0}\, \hat{b}_0\, \mathrm{e}^{-\lambda L_0} \quad (0 < \lambda < \infty)\,. \tag{6.43}$$

Moreover, it approaches the Siegel gauge as λ tends to infinity. Indeed, because $\hat{b}_0$ contains only the non-negative modes b_{2k} $(k \geq 0)$, the relation

$$\mathrm{e}^{\lambda L_0}\, b_{2k}\, \mathrm{e}^{-\lambda L_0} = \mathrm{e}^{-2k\lambda} b_{2k} \tag{6.44}$$

ensures the existence of the limit, which is exactly b_0:

$$\lim_{\lambda \to \infty} \hat{b}_0^\lambda = b_0\,. \tag{6.45}$$

From eqs. (6.43) and (6.44), we find that the vector fields $\hat{v}^\lambda$ associated with $\hat{b}_0^\lambda$ are related to $\hat{v}$ by

$$\hat{v}_{2k}^\lambda = \mathrm{e}^{-2k\lambda}\, \hat{v}_{2k} \quad (k \geq 0)\,. \tag{6.46}$$

Thus we have

$$\hat{v}^\lambda(z) = \sum_{k=-\infty}^{\infty} \hat{v}_{2k}\, \mathrm{e}^{-2k\lambda} z^{2k+1} = \mathrm{e}^{\lambda}\, \hat{v}(\mathrm{e}^{-\lambda} z) = \frac{f^\lambda(z)}{\left(f^\lambda\right)'(z)} \tag{6.47}$$

with

$$f^\lambda(z) := f(\mathrm{e}^{-\lambda} z) = \frac{2}{\pi}\, \arctan(\mathrm{e}^{-\lambda} z). \tag{6.48}$$

Consequently, the operator $\hat{b}_0^\lambda$ can be regarded as the zero mode in the conformal frame defined by the map $z \mapsto f^\lambda(z)$. Regularity of the gauges follows from the inequality

$$|\hat{v}_\perp^\lambda(z)| = \left|\Re\left[\overline{z}\, \hat{v}^\lambda(z)\right]\right| \geq 1 - \sum_{k=1}^{\infty} |\hat{v}_{2k}^\lambda| > 1 - \sum_{k=1}^{\infty} |\hat{v}_{2k}| = 0 \quad (\,|z| = 1;\ \forall \lambda > 0)\,. \tag{6.49}$$

6.1.3 Propagators in linear b-gauges

Let us calculate propagators under conditions (6.5) and (6.12). For this purpose, we rewrite the action (6.2) as

$$S = -\frac{1}{2}\langle \Psi_1, Q\Psi_1\rangle - \frac{1}{2}\sum_{g\leq 0} \left\langle \begin{bmatrix} \Psi_g \\ \Psi_{2-g} \end{bmatrix}, \begin{bmatrix} 0 & Q \\ Q & 0 \end{bmatrix} \begin{bmatrix} \Psi_g \\ \Psi_{2-g} \end{bmatrix} \right\rangle, \tag{6.50}$$

and seek the BPZ-even left inverses of Q and $\begin{bmatrix} 0 & Q \\ Q & 0 \end{bmatrix}$ in the restricted subspaces

$$\mathrm{RS}_1 := \left\{\, \Psi_1 \,\middle|\, \mathcal{B}_{(1)}\Psi_1 = 0 \,\right\}\,, \tag{6.51}$$

$$\mathrm{RS}_g := \left\{ \begin{bmatrix} \Psi_g \\ \Psi_{2-g} \end{bmatrix} \,\middle|\, \mathcal{B}_{(g)}\Psi_g = 0\,, \quad \mathcal{B}^\star_{(g+1)}\Psi_{2-g} = 0 \right\} \quad (g \leq 0)\,. \tag{6.52}$$

We would like to remark that the BPZ-even left inverses are automatically the right inverses.

First, we consider the Ψ_1-propagator Δ_1, which is the inverse of Q in the subspace RS_1. Using the identity

$$\left(\frac{\mathcal{B}_{(1)}}{\mathcal{L}_{(1)}}\,Q\,\frac{\mathcal{B}^\star_{(1)}}{\mathcal{L}^\star_{(1)}}\right)Q=\frac{\mathcal{B}_{(1)}}{\mathcal{L}_{(1)}}\left(Q\,\frac{\mathcal{B}^\star_{(1)}}{\mathcal{L}^\star_{(1)}}\,Q\right)=\frac{\mathcal{B}_{(1)}}{\mathcal{L}_{(1)}}\,Q=1-Q\,\frac{\mathcal{B}_{(1)}}{\mathcal{L}_{(1)}}\,,\tag{6.53}$$

we find with ease that

$$\Delta_1=\frac{\mathcal{B}_{(1)}}{\mathcal{L}_{(1)}}\,Q\,\frac{\mathcal{B}^\star_{(1)}}{\mathcal{L}^\star_{(1)}}\,.\tag{6.54}$$

Next, in order to obtain the ghost propagator Δ_g between Ψ_g and Ψ_{2-g} $(g\leq 0)$, we consider the BPZ-even left inverse of the matrix

$$\begin{bmatrix}0 & Q\\ Q & 0\end{bmatrix}=\begin{bmatrix}0 & Q\\ -\mathrm{bpz}(Q) & 0\end{bmatrix}.\tag{6.55}$$

We may suppose that it takes the form

$$\begin{bmatrix}0 & \Delta_g\\ \mathrm{bpz}(\Delta_g) & 0\end{bmatrix}.\tag{6.56}$$

The matrix (6.56) is determined by the equation

$$\begin{bmatrix}0 & \Delta_g\\ \mathrm{bpz}(\Delta_g) & 0\end{bmatrix}\begin{bmatrix}0 & Q\\ Q & 0\end{bmatrix}=\begin{bmatrix}1 & 0\\ 0 & 1\end{bmatrix}+\begin{bmatrix}\mathcal{M}_{(g)}\mathcal{B}_{(g)} & 0\\ 0 & \mathcal{M}_{(2-g)}\mathcal{B}^\star_{(g+1)}\end{bmatrix},\tag{6.57}$$

the right-hand side of which acts as the unit matrix in RS_g. Here $\mathcal{M}_{(g)}$ and $\mathcal{M}_{(2-g)}$ are some operators. The following two identities

$$\left(\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\,Q\,\frac{\mathcal{B}_{(g+1)}}{\mathcal{L}_{(g+1)}}\right)Q=\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\left(Q\,\frac{\mathcal{B}_{(g+1)}}{\mathcal{L}_{(g+1)}}\,Q\right)=\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\,Q=1-Q\,\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\,,\tag{6.58a}$$

$$\mathrm{bpz}\left(\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\,Q\,\frac{\mathcal{B}_{(g+1)}}{\mathcal{L}_{(g+1)}}\right)Q=\frac{\mathcal{B}^\star_{(g+1)}}{\mathcal{L}^\star_{(g+1)}}\left(Q\,\frac{\mathcal{B}^\star_{(g)}}{\mathcal{L}^\star_{(g)}}\,Q\right)=\frac{\mathcal{B}^\star_{(g+1)}}{\mathcal{L}^\star_{(g+1)}}\,Q=1-Q\,\frac{\mathcal{B}^\star_{(g+1)}}{\mathcal{L}^\star_{(g+1)}}\,,\tag{6.58b}$$

tell us that

$$\Delta_g=\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\,Q\,\frac{\mathcal{B}_{(g+1)}}{\mathcal{L}_{(g+1)}}\qquad(g\leq 0)\,.\tag{6.59}$$

In particular, if $\mathcal{B}_{(g)}=\mathcal{B}_{(g+1)}$, then we obtain

$$\Delta_g=\frac{\mathcal{B}_{(g)}}{\mathcal{L}_{(g)}}\qquad\big(\text{for }\mathcal{B}_{(g)}=\mathcal{B}_{(g+1)}\big)\,.\tag{6.60}$$

It should be noted that the structures of the propagators (6.59) and (6.60) are similar to those of (5.9) and (5.17) in the superstring field theory. In fact, the matrices $\boldsymbol{Q}$, $\boldsymbol{B}$, and $\boldsymbol{P}$ in eqs. (5.9) and (5.17) correspond respectively to Q, $\mathcal{B}$, and $1/\mathcal{L}$ in eqs. (6.59) and (6.60). As we shall see in the following subsections, we can readily extend the results in the previous sections, simply by replacing b_0's and ζ_0's in gauge-fixing matrices with linear combinations of b-modes and of ζ-modes.

6.2 Extended gauge-fixing conditions

Replacing b_0's and ζ_0's in the matrices (3.2) and (3.3) with linear combinations of b-modes and of ζ-modes, we introduce the following new gauge-fixing matrices:

$$\boldsymbol{B}^{\mathcal{Z}_{(n)};x_n,y_n}_{n+2,n+1} := \left.\underbrace{\left[\begin{array}{ccccc} \mathcal{B}_{(n)} & 0 & \cdots & \cdots & 0 \\ \hline y_n\mathcal{Z}_{(n)} & x_n\mathcal{B}_{(n)} & & & \text{\Large 0} \\ & y_n\mathcal{Z}_{(n)} & x_n\mathcal{B}_{(n)} & & \\ & & \ddots & \ddots & \\ \text{\Large 0} & & & y_n\mathcal{Z}_{(n)} & x_n\mathcal{B}_{(n)} \\ \hline 0 & \cdots & \cdots & 0 & \mathcal{Z}_{(n)} \end{array}\right]}_{n+1}\right\} n+2 \qquad (n\geq 0)\,, \tag{6.61}$$

$$\widetilde{\boldsymbol{B}}^{\mathcal{Z}_{(n)};x_n,y_n}_{n+2,n+1} := \left.\underbrace{\left[\begin{array}{ccccc} \mathcal{B}^\star_{(n)}\mathcal{Z}^\star_{(n)} & 0 & \cdots & \cdots & 0 \\ \hline x_n\mathcal{B}^\star_{(n)} & y_n\mathcal{Z}^\star_{(n)} & & & \text{\Large 0} \\ & x_n\mathcal{B}^\star_{(n)} & y_n\mathcal{Z}^\star_{(n)} & & \\ & & \ddots & \ddots & \\ \text{\Large 0} & & & x_n\mathcal{B}^\star_{(n)} & y_n\mathcal{Z}^\star_{(n)} \\ \hline 0 & \cdots & \cdots & 0 & \mathcal{B}^\star_{(n)}\mathcal{Z}^\star_{(n)} \end{array}\right]}_{n+1}\right\} n+2 \qquad (n\geq 0)\,. \tag{6.62}$$

Here x_n and y_n are real parameters satisfying $(x_n, y_n) \neq (0,0)$, and $\mathcal{B}_{(n)}$ are defined as

$$\mathcal{B}_{(n)} := \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, v^{(n)}(z)\, b(z) = \sum_{k=-\infty}^{\infty} v^{(n)}_k b_k \quad \text{with} \quad v^{(n)}(z) = \sum_{k=-\infty}^{\infty} v^{(n)}_k z^{k+1}\,. \tag{6.63}$$

The other symbols $\mathcal{Z}_{(n)}$ are utilized for denoting either $\Xi_{(n)}$ or $\mathcal{D}_{(n)}$ given by

$$\Xi_{(n)} := \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, w^{(n)}(z)\, \xi(z) = \sum_{k=-\infty}^{\infty} w^{(n)}_k \xi_k \quad \text{with} \quad w^{(n)}(z) := \frac{\mathcal{N}_{(n)}}{v^{(n)}(z)} = \sum_{k=-\infty}^{\infty} w^{(n)}_k z^{k-1}\,, \tag{6.64}$$

$$\mathcal{D}_{(n)} := \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, v^{(n)}(z)\, d(z) = \sum_{k=-\infty}^{\infty} v^{(n)}_k d_k\,. \tag{6.65}$$

Note that the identical vector fields $v^{(n)}(z)$ are used in the above definitions (6.63)-(6.65), and $w^{(n)}(z)$ are essentially $1/v^{(n)}(z)$, whose normalization constants $\mathcal{N}_{(n)} \in \mathbb{R}$ are determined later. Although one does not necessarily have to use the identical vector fields, we consider only the above forms of $\mathcal{B}_{(n)}$, $\Xi_{(n)}$, and $\mathcal{D}_{(n)}$ for simplicity. In order to guarantee the reasonableness of the gauges, we impose the same restrictions on $v^{(n)}$ as in (6.31): $v^{(n)}$ should be analytic in some neighborhood of the unit circle

$|z| = 1$ and should satisfy

$$\overline{v^{(n)}(z)} = v^{(n)}(\overline{z})\,, \quad v^{(n)}(-z) = -v^{(n)}(z) \quad \Big(\Longleftrightarrow \; v^{(n)}(z) = \sum_{k=-\infty}^{\infty} v^{(n)}_{2k}\, z^{2k+1}\,, \quad v^{(n)}_{2k} \in \mathbb{R} \Big), \tag{6.66a}$$

$$v^{(n)}_{\perp}(z) := \Re\big[\overline{z}\, v^{(n)}(z)\big] > 0 \quad \text{for} \quad |z| = 1\,. \tag{6.66b}$$

These restrictions ensure the compatibility with the reality conditions, and the validity of the Riemann surface interpretation and the Schwinger representation[23] of $1/\mathcal{L}_{(n)}$ with

$$\mathcal{L}_{(n)} = \{Q, \mathcal{B}_{(n)}\} = \{\eta_0, \mathcal{D}_{(n)}\} = \sum_{k=-\infty}^{\infty} v^{(n)}_k L_k\,. \tag{6.67}$$

We would like to remark that the reality conditions in the present case take the form[24]

$$\boldsymbol{\Phi}^{\ddagger}_{\boldsymbol{-n}} := \begin{bmatrix} \Phi^{\ddagger}_{(-n,0)} \\ \vdots \\ \Phi^{\ddagger}_{(-n,n)} \end{bmatrix} \propto \boldsymbol{\Phi}_{\boldsymbol{-n}}\,, \quad \boldsymbol{\Phi}^{\ddagger}_{\boldsymbol{n+2}} := \begin{bmatrix} \Phi^{\ddagger}_{(n+2,-1)} \\ \vdots \\ \Phi^{\ddagger}_{(n+2,-(n+1))} \end{bmatrix} \propto \boldsymbol{\Phi}_{\boldsymbol{n+2}} \qquad (n \geq 0)\,. \tag{6.68}$$

Here is another important consequence of the analyticity requirement on $v^{(n)}$ and condition (6.66b): They imply that $v^{(n)}$ is nonzero in some neighborhood of the unit circle. Thus the function $w^{(n)} \propto \frac{1}{v^{(n)}}$, also, is analytic in this neighborhood, which ensures the existence of its Laurent series valid on C_1.

The gauge-fixing conditions characterized by the operators (6.63)-(6.65),

$$\boldsymbol{B}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}} \boldsymbol{\Phi}_{\boldsymbol{-n}} = 0 \quad (n \geq 0)\,, \tag{6.69a}$$

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}} \boldsymbol{\Phi}_{\boldsymbol{n+2}} = 0 \quad (n \geq 0)\,, \tag{6.69b}$$

satisfy the consistency condition corresponding to eqs. (3.8) and (3.9):

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}} \,\mathrm{bpz}\Big(\boldsymbol{B}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}}\Big) = 0 \quad \Big(\Longleftrightarrow \; \boldsymbol{B}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}} \,\mathrm{bpz}\Big(\widetilde{\boldsymbol{B}}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n}_{\boldsymbol{n+2,n+1}}\Big) = 0 \Big) \quad (n \geq 0)\,. \tag{6.70}$$

This immediately follows from the equations below

$$\mathcal{B}^2_{(n)} = 0\,, \quad \mathcal{Z}^2_{(n)} = 0\,, \quad \{\mathcal{B}_{(n)}, \mathcal{Z}_{(n)}\} = 0\,. \tag{6.71}$$

To obtain the last equality for $\mathcal{Z} = \mathcal{D}$, we have used eq. (A.16a):

$$\begin{aligned} \{\mathcal{B}_{(n)}, \mathcal{D}_{(n)}\} &= \oint_{C_1} \frac{\mathrm{d}z_1}{2\pi\mathrm{i}} \oint_{C_1} \frac{\mathrm{d}z_2}{2\pi\mathrm{i}}\, v^{(n)}(z_1) v^{(n)}(z_2) \Big(\frac{2}{z_{12}^2} \xi b(z_2) + \frac{1}{z_{12}} \partial(\xi b)(z_2) \Big) \\ &= \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}} \Big(2\partial v^{(n)} v^{(n)}\, \xi b + v^{(n)} v^{(n)}\, \partial(\xi b) \Big)(z) = \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, \partial\Big(v^{(n)} v^{(n)}\, \xi b \Big)(z) = 0\,. \end{aligned} \tag{6.72}$$

One should note that the gauge-fixing conditions (6.69) contain two types of gauges for each $n \geq 0$: $\mathcal{B}_{(n)}$-$\Xi_{(n)}$ gauges and $\mathcal{B}_{(n)}$-$\mathcal{D}_{(n)}$ gauges. As was emphasized at the end of section 3, one does not have to adopt the same type of gauge-fixing conditions for every $n \geq 0$.

---

[23] The proof of the validity of the Schwinger representation given in ref. [24] can be applied also to the present case.

[24] In particular, the reality condition of $\Phi_{(0,0)}$ is investigated in detail in appendix B.

6.2.1 $\mathcal{B}_{(n)}$-$\Xi_{(n)}$ gauges

For a reason to be mentioned later, we choose the normalization constant $\mathcal{N}_{(n)}$ in eq. (6.64) such that $w_0^{(n)}$ is set equal to one. In order for this to be possible, in $\mathcal{B}_{(n)}$-$\Xi_{(n)}$ gauges, we require[25]

$$\oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} \frac{1}{v^{(n)}(z)} \neq 0 \,. \tag{6.73}$$

In this case, the constant $\mathcal{N}_{(n)}$ is given by

$$\mathcal{N}_{(n)} = \left(\oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} \frac{1}{v^{(n)}(z)} \right)^{-1} , \tag{6.74}$$

realizing the normalization

$$w_0^{(n)} = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} w^{(n)}(z) = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} \frac{\mathcal{N}_{(n)}}{v^{(n)}(z)} = 1 \,. \tag{6.75}$$

Using this $w^{(n)}$, we define $\mathcal{C}_{(n)}$ as

$$\mathcal{C}_{(n)} := \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} \frac{w^{(n)}(z)}{v^{(n)}(z)} = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}} \frac{\mathcal{N}_{(n)}}{\left(v^{(n)}(z)\right)^2} \,. \tag{6.76}$$

Under the above normalization (6.75), the operators Q, η_0, $\mathcal{B}_{(n)}$, $\mathcal{C}_{(n)}$, and $\Xi_{(n)}$ satisfy the same algebraic relations as Q, η_0, b_0, c_0, and ξ_0:

$$Q^2 = \eta_0^2 = \mathcal{B}_{(n)}^2 = \mathcal{C}_{(n)}^2 = \Xi_{(n)}^2 = 0 \,, \tag{6.77a}$$

$$\{Q, \eta_0\} = \{\eta_0, \mathcal{B}_{(n)}\} = \{\eta_0, \mathcal{C}_{(n)}\} = \{\mathcal{B}_{(n)}, \Xi_{(n)}\} = \{\mathcal{C}_{(n)}, \Xi_{(n)}\} = 0 \,, \tag{6.77b}$$

$$\{\mathcal{B}_{(n)}, \mathcal{C}_{(n)}\} = \{\eta_0, \Xi_{(n)}\} = 1 \,, \tag{6.77c}$$

$$\{Q, \mathcal{B}_{(n)}\} = \mathcal{L}_{(n)} \,, \quad \{Q, \Xi_{(n)}\} =: \mathcal{X}_{(n)} \,, \tag{6.77d}$$

$$[\mathcal{L}_{(n)}, Q] = [\mathcal{L}_{(n)}, \eta_0] = [\mathcal{L}_{(n)}, \mathcal{B}_{(n)}] = [\mathcal{L}_{(n)}, \mathcal{C}_{(n)}] = [\mathcal{L}_{(n)}, \Xi_{(n)}] = 0 \,, \tag{6.77e}$$

$$[\mathcal{X}_{(n)}, Q] = [\mathcal{X}_{(n)}, \eta_0] = [\mathcal{X}_{(n)}, \mathcal{B}_{(n)}] = [\mathcal{X}_{(n)}, \Xi_{(n)}] = 0 \,, \tag{6.77f}$$

which can be shown in the manner explained below eq. (6.71). The reason why we have adjusted $w_0^{(n)}$ to one is to achieve these relations. When we proved the validity of conditions (4.12) and (4.13) for $\zeta_0 = \xi_0$, we used only the algebraic relations among Q, η_0, b_0, c_0, and ξ_0. Hence, for $\mathcal{Z}_{(n)} = \Xi_{(n)}$, the corresponding relations (6.77) and their BPZ conjugates suffice to ensure the validity of condition (6.69a) and that of (6.69b), respectively, *if* $x_n = 0$ or $y_n = 0$. However, if x_n and y_n are nonzero, there may exist a problem related to the inverse of the operator $x_n \mathcal{L}_{(n)} + y_n$, which is the counterpart of $x_n L_0 + y_n$ in b_0-ξ_0 gauges: we may not be able to take the well-defined inverse of $x_n \mathcal{L}_{(n)} + y_n$. In order to avoid this potential complexity, in $\mathcal{B}_{(n)}$-$\Xi_{(n)}$ gauges, we will restrict ourselves within the cases in which $x_n = 0$ or $y_n = 0$.

---

[25] In $\mathcal{B}_{(n)}$-$\mathcal{D}_{(n)}$ gauges, we do not impose this constraint on $v^{(n)}$.

6.2.2 $\mathcal{B}_{(n)}$-$\mathcal{D}_{(n)}$ gauges

In $\mathcal{B}_{(n)}$-$\mathcal{D}_{(n)}$ gauges, we have the following algebraic relations among Q, η_0, $\mathcal{B}_{(n)}$, and $\mathcal{D}_{(n)}$, without requiring condition (6.73).

$$Q^2 = \eta_0^2 = \mathcal{B}_{(n)}^2 = \mathcal{D}_{(n)}^2 = 0\,, \tag{6.78a}$$

$$\{Q, \eta_0\} = \{Q, \mathcal{D}_{(n)}\} = \{\eta_0, \mathcal{B}_{(n)}\} = \{\mathcal{B}_{(n)}, \mathcal{D}_{(n)}\} = 0\,, \tag{6.78b}$$

$$\{Q, \mathcal{B}_{(n)}\} = \{\eta_0, \mathcal{D}_{(n)}\} = \mathcal{L}_{(n)}\,, \tag{6.78c}$$

$$[\mathcal{L}_{(n)}, Q] = [\mathcal{L}_{(n)}, \eta_0] = [\mathcal{L}_{(n)}, \mathcal{B}_{(n)}] = [\mathcal{L}_{(n)}, \mathcal{D}_{(n)}] = 0\,. \tag{6.78d}$$

These relations and their BPZ conjugates are the same as the relations among Q, η_0, b_0, and d_0; hence the validity of conditions (6.69a) and (6.69b) for $\mathcal{Z}_{(n)} = \mathcal{D}_{(n)}$ is guaranteed. In $\mathcal{B}_{(n)}$-$\mathcal{D}_{(n)}$ gauges, for the same reason explained in section 4.1, the parameters x_n and y_n have to satisfy $x_n + y_n \neq 0$.

6.2.3 A one-parameter family of regular gauges

Let us consider the one-parameter family of vector fields (6.47) in the case of $\mathcal{B}_{(n)}$-$\mathcal{Z}_{(n)}$ gauges. The vector field $\hat{v}^\lambda$ $(0 < \lambda < \infty)$ satisfies

$$\oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}} \frac{1}{\hat{v}^\lambda(z)} = 1\,. \tag{6.79}$$

Therefore, if we set $v^{(n)} = \hat{v}^\lambda$, we have $\mathcal{N}_{(n)} = 1$ and find that the operators

$$\mathcal{B}_{(n)} = \hat{b}_0^\lambda = \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, \hat{v}^\lambda(z)\, b(z)\,, \tag{6.80}$$

$$\Xi_{(n)} = \hat{\xi}_0^\lambda := \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}} \frac{1}{\hat{v}^\lambda(z)}\, \xi(z)\,, \tag{6.81}$$

$$\mathcal{D}_{(n)} = \hat{d}_0^\lambda := \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}}\, \hat{v}^\lambda(z)\, d(z) \tag{6.82}$$

are precisely the zero modes in the conformal frame associated with the function f^λ in eq. (6.48). We have already investigated $\hat{b}_0^\lambda$ in detail in section 6.1.2: it interpolates between the canonical zero mode b_0 and the zero mode in the sliver frame $\hat{b}_0$, providing a regularization of the latter. It can be confirmed that the same applies to $\hat{\xi}_0^\lambda$ and $\hat{d}_0^\lambda$, by noting that

$$\hat{v}^\lambda(z) \to \begin{cases} z & (\lambda \to \infty)\,, \\ \hat{v}(z) & (\lambda \to 0)\,. \end{cases} \tag{6.83}$$

However, the limit

$$\lim_{\lambda\to 0} \hat{\xi}_0^\lambda = \lim_{\lambda\to 0} \oint_{C_1} \frac{\mathrm{d}z}{2\pi\mathrm{i}} \frac{1}{\hat{v}^\lambda(z)}\, \xi(z) \tag{6.84}$$

needs careful treatment. To see this, we consider the naive zero modes in the sliver frame

$$\hat{b}_0 = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, \hat{v}(z)\, b(z)\,, \quad \hat{\xi}_0 = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, \frac{1}{\hat{v}(z)}\, \xi(z)\,, \quad \hat{d}_0 = \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, \hat{v}(z)\, d(z)\,. \tag{6.85}$$

The point is that unlike $\hat{b}_0$ and $\hat{d}_0$, the operator $\hat{\xi}_0$ itself is singular: the function $1/\hat{v}$ diverges at $z = \pm\mathrm{i}$ (see eq. (6.42)), and thus there does not exist a Laurent expansion valid on the unit circle C_1. Hence one must not perform the interchange of the integral and the limit:

$$\lim_{\lambda\to 0} \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, \frac{1}{\hat{v}^{\lambda}(z)}\, \xi(z) \;\neq\; \oint_{C_1} \frac{\mathrm{d}z}{2\pi \mathrm{i}}\, \lim_{\lambda\to 0} \frac{1}{\hat{v}^{\lambda}(z)}\, \xi(z)\,. \tag{6.86}$$

By contrast, in the $\lambda \to \infty$ limit, there exists no such complexity. The parameterized gauges are reduced exactly to the b_0-ζ_0 gauges (3.1) investigated in sections 3-5.

6.3 Extended propagators

Propagators in $\mathcal{B}_{(n)}$-$\mathcal{Z}_{(n)}$ gauges can be readily derived in the manner explained in section 5. For $\mathcal{B}_{(n)}$-$\Xi_{(n)}$ gauges, we implicitly restrict ourselves within the cases in which $x_n = 0$ or $y_n = 0$. (See the last two sentences in section 6.2.1.)

6.3.1 Extended $\boldsymbol{\Phi_0}$-propagator

First, let us determine the $\boldsymbol{\Phi_0}$-propagator $\boldsymbol{\Delta}_{\mathbf{1,0}}$. All we have to do is to find the BPZ-even left inverse of $\boldsymbol{Q}_{\mathbf{0,1}} = \mathrm{i}\, Q\eta_0$ in the restricted subspace

$$\mathrm{RS}_0^{\mathcal{Z}} := \left\{ \boldsymbol{\Phi_0} \;\middle|\; \boldsymbol{B}_{\mathbf{2,1}}^{\boldsymbol{\mathcal{Z}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}} \boldsymbol{\Phi_0} = 0 \right\}. \tag{6.87}$$

We define

$$\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{\Xi}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}} := \mathrm{i}\, \frac{\mathcal{B}_{(0)}\, \Xi_{(0)}}{\mathcal{L}_{(0)}}\,, \quad \boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{\mathcal{D}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}} := \mathrm{i}\, \frac{\mathcal{B}_{(0)}\, \mathcal{D}_{(0)}}{\mathcal{L}_{(0)}^2}\,. \tag{6.88}$$

(Compare these operators with $\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{\xi_0};\boldsymbol{x},\boldsymbol{y}}$ and $\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{d_0};\boldsymbol{x},\boldsymbol{y}}$ in eqs. (E.1a) and (E.9).) Then the following equation holds:

$$\Big(\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{\mathcal{Z}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}\, \boldsymbol{Q}_{\mathbf{0,1}}\, \mathrm{bpz}\Big(\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{\mathcal{Z}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}\Big)\Big)\, \boldsymbol{Q}_{\mathbf{0,1}} = 1 + \boldsymbol{M}_{\mathbf{1,2}}^{\boldsymbol{\mathcal{Z}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}\, \boldsymbol{B}_{\mathbf{2,1}}^{\boldsymbol{\mathcal{Z}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}}\,, \tag{6.89}$$

with

$$\boldsymbol{M}_{\mathbf{1,2}}^{\boldsymbol{\Xi}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}} := \begin{bmatrix} -\Xi_{(0)}\eta_0 \tfrac{Q}{\mathcal{L}_{(0)}} & \quad -\eta_0 \end{bmatrix}, \tag{6.90a}$$

$$\boldsymbol{M}_{\mathbf{1,2}}^{\boldsymbol{\mathcal{D}}_{(0)};\boldsymbol{x_0},\boldsymbol{y_0}} := \begin{bmatrix} -\Big(1 - \tfrac{y_0}{x_0+y_0} \tfrac{\eta_0 \mathcal{D}_{(0)}}{\mathcal{L}_{(0)}}\Big) \tfrac{Q}{\mathcal{L}_{(0)}} & \quad -\Big(1 - \tfrac{x_0}{x_0+y_0} \tfrac{Q\mathcal{B}_{(0)}}{\mathcal{L}_{(0)}}\Big) \tfrac{\eta_0}{\mathcal{L}_{(0)}} \end{bmatrix}. \tag{6.90b}$$

(Note that the matrices in eq. (6.90) are similar to those in eqs. (D.5a) and (D.19).) The right-hand side of eq. (6.89) acts as the identity operator in $\mathrm{RS}_0^{\mathcal{Z}}$. Thus we conclude that $\boldsymbol{\Delta}_{\boldsymbol{1,0}}$ is given by

$$\boldsymbol{\Delta}_{\boldsymbol{1,0}} = \boldsymbol{K}_{\boldsymbol{1,0}}^{\boldsymbol{\mathcal{Z}_{(0)};x_0,y_0}} \boldsymbol{Q}_{\boldsymbol{0,1}} \,\mathrm{bpz}\Big(\boldsymbol{K}_{\boldsymbol{1,0}}^{\boldsymbol{\mathcal{Z}_{(0)};x_0,y_0}}\Big) = \begin{cases} -\,\mathrm{i}\,\dfrac{\mathcal{B}_{(0)}\,\Xi_{(0)}}{\mathcal{L}_{(0)}}\, Q\eta_0\, \dfrac{\mathcal{B}^\star_{(0)}\,\Xi^\star_{(0)}}{\mathcal{L}^\star_{(0)}} & \text{for} \quad \mathcal{Z}_{(0)} = \Xi_{(0)}\,, \\[2ex] -\,\mathrm{i}\,\dfrac{\mathcal{B}_{(0)}\mathcal{D}_{(0)}}{\mathcal{L}^2_{(0)}}\, Q\eta_0\, \dfrac{\mathcal{B}^\star_{(0)}\mathcal{D}^\star_{(0)}}{\big(\mathcal{L}^\star_{(0)}\big)^2} & \text{for} \quad \mathcal{Z}_{(0)} = \mathcal{D}_{(0)}\,. \end{cases} \tag{6.91}$$

This expression is of the same form as in eq. (6.54).

6.3.2 Extended ghost propagators

Next we determine ghost propagators $\boldsymbol{\Delta}_{\boldsymbol{n+1,n}}$ $(n \geq 1)$. In what follows, we denote n-independent versions of the operators $\mathcal{B}_{(n)}$, $\Xi_{(n)}$, $\mathcal{D}_{(n)}$, $\mathcal{X}_{(n)}$, and $\mathcal{L}_{(n)}$ by the symbols $\mathcal{B}$, Ξ, $\mathcal{D}$, $\mathcal{X}$, and $\mathcal{L}$, respectively. The vector field associated with them will be represented by $v(z)$. Furthermore, we let untilded (resp. tilded) matrices with the superscript $\mathcal{Z}_{(n)}$ denote those obtained from the untilded (resp. tilded) matrices with the superscript ζ_0 by replacing the zero modes b_0, ξ_0, d_0, X_0, and L_0 with $\mathcal{B}_{(n)}$, $\Xi_{(n)}$, $\mathcal{D}_{(n)}$, $\mathcal{X}_{(n)}$, and $\mathcal{L}_{(n)}$ (resp. $\mathcal{B}^\star_{(n)}$, $\Xi^\star_{(n)}$, $\mathcal{D}^\star_{(n)}$, $\mathcal{X}^\star_{(n)}$, and $\mathcal{L}^\star_{(n)}$). Recall that the extended gauge-fixing matrices (6.61) and (6.62) were obtained from $\boldsymbol{B}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0;x_n,y_n}}$ and $\widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\zeta_0;x_n,y_n}}$ by performing the above-mentioned replacement. Matrices with the superscript $\mathcal{Z}$ (not $\mathcal{Z}_{(n)}$) should be interpreted similarly.

In section 6.2, we have mentioned that in virtue of the relations (6.77) and (6.78), validity of $\mathcal{B}_{(n)}$-$\mathcal{Z}_{(n)}$ gauges can be proved in the same manner as that of b_0-ζ_0 gauges. In fact, we find that the matrices

$$\boldsymbol{K}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z};x,y}} = \boldsymbol{P}_{\boldsymbol{n+1,n+1}}^{\boldsymbol{\mathcal{Z};x,y}} \boldsymbol{B}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z};x,y}} \quad (n \geq 0)\,, \quad \widetilde{\boldsymbol{K}}_{\boldsymbol{n,n+1}}^{\boldsymbol{\mathcal{Z};x,y}} = \widetilde{\boldsymbol{P}}_{\boldsymbol{n,n+2}}^{\boldsymbol{\mathcal{Z};x,y}}\, \widetilde{\boldsymbol{B}}_{\boldsymbol{n+2,n+1}}^{\boldsymbol{\mathcal{Z};x,y}} \quad (n \geq 1)\,, \tag{6.92}$$

together with the gauge-fixing matrices (6.61) and (6.62), satisfy the same relations as in proposition 4.5. Thus, the ghost propagator $\boldsymbol{\Delta}_{\boldsymbol{n+1,n}}$ in extended gauges is given by

$$\boldsymbol{\Delta}_{\boldsymbol{n+1,n}} = \boldsymbol{K}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z}_{(n)};x_n,y_n}} \boldsymbol{Q}_{\boldsymbol{n,n+1}} \boldsymbol{K}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z}_{(n-1)};x_{n-1},y_{n-1}}} \quad (n \geq 1)\,. \tag{6.93}$$

Compare this result with eqs. (5.9) and (6.59). If the vector fields and the parameters satisfy

$$v^{(n-1)}(z) = v^{(n)}(z)\,(= v(z))\,, \quad x_{n-1} = x_n\,(= x)\,, \quad y_{n-1} = y_n\,(= y)\,, \tag{6.94}$$

the above propagator is simplified to

$$\boldsymbol{\Delta}_{\boldsymbol{n+1,n}} = \boldsymbol{K}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z};x,y}}\,. \tag{6.95}$$

Before closing the present section, we list the concrete forms of $\boldsymbol{K}_{\boldsymbol{n+1,n}}^{\boldsymbol{\mathcal{Z};x,y}}$. They are the extensions of the matrices shown in section 5.3.

(I) $\boldsymbol{\mathcal{Z}} = \boldsymbol{\Xi}$ case

For $x = 0$, we have

$$\boldsymbol{K}_{\mathbf{1},\mathbf{0}}^{\boldsymbol{\Xi};\mathbf{0},\boldsymbol{y}} = \mathrm{i}\,\frac{\mathcal{B}\,\Xi}{\mathcal{L}}\,, \quad \boldsymbol{K}_{\mathbf{2},\mathbf{1}}^{\boldsymbol{\Xi};\mathbf{0},\boldsymbol{y}} = \begin{bmatrix} \frac{\Xi\eta_0\mathcal{B}}{\mathcal{L}} \\ \\ \Xi\big(1 - \frac{\mathcal{X}\eta_0\mathcal{B}}{\mathcal{L}}\big) \end{bmatrix} =: \begin{bmatrix} \mathcal{E} \\ \\ \mathcal{F} \end{bmatrix}, \quad \boldsymbol{K}_{\mathbf{3},\mathbf{2}}^{\boldsymbol{\Xi};\mathbf{0},\boldsymbol{y}} = \begin{bmatrix} \mathcal{E} & 0 \\ \mathcal{F} & 0 \\ (-\mathcal{X})\mathcal{F} & \Xi \end{bmatrix}, \tag{6.96a}$$

$$\boldsymbol{K}_{\boldsymbol{n}+\mathbf{1},\boldsymbol{n}}^{\boldsymbol{\Xi};\mathbf{0},\boldsymbol{y}} = \begin{bmatrix} \mathcal{E} & 0 & 0 & 0 & \cdots & 0 & 0 \\ \mathcal{F} & 0 & 0 & 0 & \cdots & 0 & 0 \\ (-\mathcal{X})\mathcal{F} & \Xi & 0 & 0 & \cdots & 0 & 0 \\ (-\mathcal{X})^2\mathcal{F} & (-\mathcal{X})\Xi & \Xi & 0 & \cdots & 0 & 0 \\ (-\mathcal{X})^3\mathcal{F} & (-\mathcal{X})^2\Xi & (-\mathcal{X})\Xi & \Xi & \cdots & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ (-\mathcal{X})^{n-2}\mathcal{F} & (-\mathcal{X})^{n-3}\Xi & (-\mathcal{X})^{n-4}\Xi & (-\mathcal{X})^{n-5}\Xi & \cdots & \Xi & 0 \\ (-\mathcal{X})^{n-1}\mathcal{F} & (-\mathcal{X})^{n-2}\Xi & (-\mathcal{X})^{n-3}\Xi & (-\mathcal{X})^{n-4}\Xi & \cdots & (-\mathcal{X})\Xi & \Xi \end{bmatrix} \quad (n \geq 1)\,; \tag{6.96b}$$

and for $y = 0$, we have

$$\boldsymbol{K}_{\mathbf{1},\mathbf{0}}^{\boldsymbol{\Xi};\boldsymbol{x},\mathbf{0}} = \mathrm{i}\,\frac{\mathcal{B}\,\Xi}{\mathcal{L}}\,, \quad \boldsymbol{K}_{\mathbf{2},\mathbf{1}}^{\boldsymbol{\Xi};\boldsymbol{x},\mathbf{0}} = \begin{bmatrix} \frac{\mathcal{B}}{\mathcal{L}} \\ \frac{\Xi\mathcal{B}Q}{\mathcal{L}} \end{bmatrix}, \quad \boldsymbol{K}_{\mathbf{3},\mathbf{2}}^{\boldsymbol{\Xi};\boldsymbol{x},\mathbf{0}} = \begin{bmatrix} \frac{\mathcal{B}}{\mathcal{L}} & 0 \\ 0 & \frac{\mathcal{B}}{\mathcal{L}} \\ 0 & \frac{\Xi\mathcal{B}Q}{\mathcal{L}} \end{bmatrix}, \tag{6.97a}$$

$$\boldsymbol{K}_{\boldsymbol{n}+\mathbf{1},\boldsymbol{n}}^{\boldsymbol{\Xi};\boldsymbol{x},\mathbf{0}} = \begin{bmatrix} \frac{\mathcal{B}}{\mathcal{L}} & & & & \Huge{0} \\ & \frac{\mathcal{B}}{\mathcal{L}} & & & \\ & & \ddots & & \\ & & & \frac{\mathcal{B}}{\mathcal{L}} & \\ & & & & \frac{\mathcal{B}}{\mathcal{L}} \\ \Huge{0} & & & & \frac{\Xi\mathcal{B}Q}{\mathcal{L}} \end{bmatrix} \quad (n \geq 1)\,. \tag{6.97b}$$

(II) $\boldsymbol{\mathcal{Z}} = \boldsymbol{\mathcal{D}}$ case

$$\boldsymbol{K}_{\mathbf{1},\mathbf{0}}^{\boldsymbol{\mathcal{D}};\boldsymbol{x},\boldsymbol{y}} = \mathrm{i}\,\frac{\mathcal{B}\mathcal{D}}{\mathcal{L}^2}\,, \quad \boldsymbol{K}_{\mathbf{2},\mathbf{1}}^{\boldsymbol{\mathcal{D}};\boldsymbol{x},\boldsymbol{y}} = \begin{bmatrix} K_{\mathcal{B}} \\ K_{\mathcal{D}} \end{bmatrix}, \quad \boldsymbol{K}_{\mathbf{3},\mathbf{2}}^{\boldsymbol{\mathcal{D}};\boldsymbol{x},\boldsymbol{y}} = \begin{bmatrix} K_{\mathcal{B}} & 0 \\ \frac{y\mathcal{D}}{\mathcal{L}_{x,y}} & \frac{x\mathcal{B}}{\mathcal{L}_{x,y}} \\ 0 & K_{\mathcal{D}} \end{bmatrix}, \tag{6.98a}$$

$$\boldsymbol{K}^{\boldsymbol{\mathcal{D};x,y}}_{\boldsymbol{n+1,n}} = \begin{bmatrix} K_{\mathcal{B}} & & & & \text{\Large 0} \\ \frac{y\mathcal{D}}{\mathcal{L}_{x,y}} & \frac{x\mathcal{B}}{\mathcal{L}_{x,y}} & & & \\ & \frac{y\mathcal{D}}{\mathcal{L}_{x,y}} & \frac{x\mathcal{B}}{\mathcal{L}_{x,y}} & & \\ & & \ddots & \ddots & \\ & & & \frac{y\mathcal{D}}{\mathcal{L}_{x,y}} & \frac{x\mathcal{B}}{\mathcal{L}_{x,y}} \\ \text{\Large 0} & & & & K_{\mathcal{D}} \end{bmatrix} \quad (n \geq 1)\,, \tag{6.98b}$$

with

$$K_{\mathcal{B}} := \frac{\mathcal{B}}{\mathcal{L}}\Big(1 - y\frac{\eta_0\mathcal{D}}{\mathcal{L}_{x,y}}\Big), \quad K_{\mathcal{D}} := \frac{\mathcal{D}}{\mathcal{L}}\Big(1 - x\frac{Q\mathcal{B}}{\mathcal{L}_{x,y}}\Big), \quad \mathcal{L}_{x,y} := (x+y)\mathcal{L}\,. \tag{6.99}$$

7 Summary and discussion

In the present paper, we have made a detailed analysis on validity of gauge-fixing conditions and the structure of propagators in the WZW-type open superstring field theory. First, we have proposed a class of gauge-fixing conditions of the form

$$\boldsymbol{B}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi_{-n}} = 0 \quad (n \geq 0)\,, \tag{7.1a}$$

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\boldsymbol{\Phi_{n+2}} = 0 \quad (n \geq 0)\,. \tag{7.1b}$$

Compatibility with the BRST transformation requires that the gauge-fixing matrices satisfy

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\,\mathrm{bpz}\bigg(\boldsymbol{B}^{\boldsymbol{\zeta_0^{(n)};x_n,y_n}}_{\boldsymbol{n+2,n+1}}\bigg) = 0 \quad (n \geq 0)\,. \tag{7.2}$$

Then, we have demonstrated validity of condition (7.1) by proving reachability and completeness. In particular, the proof of the completeness was accomplished by showing the existence of the matrices $\boldsymbol{P}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n+1}}$ $(n \geq 0)$ and $\widetilde{\boldsymbol{P}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+2}}$ $(n \geq 1)$ such that

$$\boldsymbol{P}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n+1}}\boldsymbol{B}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}}\boldsymbol{Q_{n,n+1}} = \boldsymbol{1_{n+1}} + \boldsymbol{M}^{\boldsymbol{\zeta_0;xy}}_{\boldsymbol{n+1,n+2}}\boldsymbol{B}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \quad (n \geq 0)\,, \tag{7.3a}$$

$$\widetilde{\boldsymbol{P}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+2}}\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}}\boldsymbol{Q_{n+1,n}} = \boldsymbol{1_n} + \widetilde{\boldsymbol{M}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+1}}\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \quad (n \geq 1)\,. \tag{7.3b}$$

We have found that the product of $\boldsymbol{P}$ and $\boldsymbol{B}$, and that of $\widetilde{\boldsymbol{P}}$ and $\widetilde{\boldsymbol{B}}$,

$$\boldsymbol{K}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} = \boldsymbol{P}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n+1}}\boldsymbol{B}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+1,n}} \quad (n \geq 0)\,, \quad \widetilde{\boldsymbol{K}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+1}} = \widetilde{\boldsymbol{P}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n,n+2}}\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}} \quad (n \geq 1)\,, \tag{7.4}$$

provide the key ingredients of propagators, satisfying the important relations (4.38)-(4.43). The $\boldsymbol{\Phi_0}$-propagator $\boldsymbol{\Delta_{1,0}}$ and the ghost propagators $\boldsymbol{\Delta_{n+1,n}}$ $(n \geq 1)$ are given by

$$\boldsymbol{\Delta_{1,0}} = \boldsymbol{K}^{\boldsymbol{\zeta_0^{(0)};x_0,y_0}}_{\boldsymbol{1,0}}\,, \tag{7.5}$$

$$\boldsymbol{\Delta}_{n+1,n} = \boldsymbol{K}_{n+1,n}^{\zeta_0^{(n)};x_n,y_n} \boldsymbol{Q}_{n,n+1} \boldsymbol{K}_{n+1,n}^{\zeta_0^{(n-1)};x_{n-1},y_{n-1}} \qquad (n \geq 1)\,. \tag{7.6}$$

Furthermore, we have also investigated the case in which $\boldsymbol{B}$ and $\widetilde{\boldsymbol{B}}$ are composed of linear combinations of world-sheet oscillators, including nonzero modes, and have obtained the corresponding propagators

$$\boldsymbol{\Delta}_{1,0} = \boldsymbol{K}_{1,0}^{\boldsymbol{\mathcal{Z}}_{(0)};x_0,y_0} \boldsymbol{Q}_{0,1}\, \mathrm{bpz}\Big(\boldsymbol{K}_{1,0}^{\boldsymbol{\mathcal{Z}}_{(0)};x_0,y_0}\Big), \tag{7.7}$$

$$\boldsymbol{\Delta}_{n+1,n} = \boldsymbol{K}_{n+1,n}^{\boldsymbol{\mathcal{Z}}_{(n)};x_n,y_n} \boldsymbol{Q}_{n,n+1} \boldsymbol{K}_{n+1,n}^{\boldsymbol{\mathcal{Z}}_{(n-1)};x_{n-1},y_{n-1}} \qquad (n \geq 1)\,. \tag{7.8}$$

In our analysis, gauge-fixing matrices were constructed from the world-sheet operators b and ζ, with ζ denoting either ξ or $d = [Q, b\xi]$. Particularly, if we employ b_0-d_0 gauges, propagators take simple forms, in virtue of the relations (2.72) originating from the twisted $N = 2$ superconformal algebra [29]. However, as was mentioned in section 5.3, these propagators involve the inverse of L_0^2 rather than that of L_0. Although the on-shell four-point tree amplitude was correctly reproduced [30] under the gauge choice

$$b_0\Phi_{(0,0)} = d_0\Phi_{(0,0)} = 0\,, \tag{7.9}$$

we have not yet known much about b_0-d_0 gauges. In order to deepen our understanding, let us now discuss the gauge (7.9) from the viewpoint of the massless component field of $\Phi_{(0,0)}$.

At the massless level, the GSO-even string field $\Phi_{(0,0)}$ and its gauge parameters $\Lambda_{(-1,0)}$ and $\Lambda_{(-1,1)}$ are expanded as[26]

$$\Phi_{(0,0)} = \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \Big(\mathrm{i}\varphi(k)\,|0;k\rangle + A_\mu(k)\big[\psi^\mu\xi c\big]_{z=0}|{-1};k\rangle + \mathrm{i}B(k)\big[\xi\partial\xi c\partial c\big]_{z=0}|{-2};k\rangle\Big), \tag{7.10}$$

$$\Lambda_{(-1,0)} = \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \Big(\frac{\mathrm{i}}{2}\lambda(k)\big[\xi\partial\xi c\big]_{z=0}|{-2};k\rangle\Big), \tag{7.11}$$

$$\Lambda_{(-1,1)} = \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \Big(\mathrm{i}\omega(k)\,\xi|_{z=0}\,|0;k\rangle\Big). \tag{7.12}$$

Here φ, A_μ, B, λ, and ω are real component fields. (For the reality, see appendix B.) The action (2.1) and the gauge transformation (2.3) are reduced to

$$\begin{aligned} S_0 &= -\frac{\mathrm{i}}{2}\,\langle\Phi_{(0,0)}, Q\eta_0\Phi_{(0,0)}\rangle \\ &= \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \left[-\frac{1}{2}A_\mu(-k)k^2\eta^{\mu\nu}A_\nu(k) + \mathrm{i}B(-k)k^\mu A_\mu(k) - \frac{1}{2}B(-k)B(k)\right] \\ &= \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \left[-\frac{1}{2}A_\mu(-k)\left(k^2\eta^{\mu\nu} - k^\mu k^\nu\right)A_\nu(k) - \frac{1}{2}\widetilde{B}(-k)\widetilde{B}(k)\right], \end{aligned} \tag{7.13}$$

---

[26] Here we use real component fields by separating "i" appropriately. See appendices A and B for our convention.

$$\delta\varphi(k) = \omega(k) - \frac{1}{2}\,\lambda(k)\,, \tag{7.14a}$$

$$\delta A_\mu(k) = \mathrm{i}k_\mu\lambda(k)\,, \tag{7.14b}$$

$$\delta B(k) = -k^2\lambda(k)\,, \quad \delta\widetilde{B}(k) = 0\,, \tag{7.14c}$$

with

$$\widetilde{B}(k) := B(k) - \mathrm{i}k^\mu A_\mu(k)\,. \tag{7.15}$$

To obtain the above action (7.13), we have used the normalization convention (B.30). We can express gauge-fixing conditions on $\Phi_{(0,0)}$ in terms of its component fields as follows:

$$b_0\Phi_{(0,0)} = 0 \iff B(k) = 0\,, \tag{7.16}$$

$$\xi_0\Phi_{(0,0)} = 0 \iff \varphi(k) = 0\,, \tag{7.17}$$

$$d_0\Phi_{(0,0)} = 0 \iff k^2\varphi(k) - \mathrm{i}k^\mu A_\mu(k) + \frac{1}{2}B(k) = 0\,. \tag{7.18}$$

If we impose condition (7.16), the resultant action is precisely the one in the Feynman gauge, and conditions (7.17) and (7.18) determine the value of φ:

$$\xi_0\Phi_{(0,0)} = 0 \implies \varphi(k) = 0\,, \tag{7.19}$$

$$d_0\Phi_{(0,0)} = 0 \implies \varphi(k) = \frac{\mathrm{i}k^\mu A_\mu(k)}{k^2}\,. \tag{7.20}$$

Although these two values are different, since the component field $\varphi(k)$ does not appear in the action, we conclude that the b_0-ξ_0 gauge and the b_0-d_0 gauge lead to the same gauge-fixed action, at least for the massless gauge field A_μ.[27] Consequently, the propagator of A_μ takes the regular form even in the b_0-d_0 gauge. This can be interpreted as follows. Eq. (A.14) tells us that the zero mode d_0 is composed of $\xi_0 L_0$ and the terms not including L_0. Thus we obtain

$$\frac{d_0}{L_0} = \xi_0 + \frac{1}{L_0} \times (\text{the sum of the operators not including } L_0)\ . \tag{7.21}$$

Our analysis in the present section suggests that in the b_0-d_0 gauge, the factor d_0/L_0 in the propagator $\boldsymbol{\Delta}_{\mathbf{1,0}}$ will be effectively the same as ξ_0, and the second term on the right-hand side of eq. (7.21) will be negligible. Therefore, we expect that b_0-d_0 gauges, also, will be physically reasonable gauges.

We have dealt with only the free theory throughout the present paper. In order to complete gauge fixing, however, we have to consider also the interaction terms. As can be seen from eq. (2.51), in the WZW-type superstring field theory, unlike in bosonic string field theory [4], the extended action S does not take the same form as the original action S_0. This makes it difficult to obtain completely gauge-fixed action in the interacting theory. Although we have not yet succeeded in solving the problem, several approaches are proposed in refs. [19, 21].

---

[27] When we consider the interacting theory, the action contains φ, which shall be eliminated through condition (7.19) or (7.20).

Acknowledgments

A Algebraic relations

We "bosonize" the superconformal ghosts β and γ as[28]

$$\beta = \mathrm{e}^{-\phi}\partial\xi\,, \quad \gamma = \eta\mathrm{e}^{\phi}\,. \tag{A.1}$$

Here and in the sequel, we use the convention in which appropriate cocycle factors are implicitly included. Thus $\mathrm{e}^{l\phi}$ ($l \in$ odd) anticommutes with fermionic operators, such as b, c, ξ, and η. The world-sheet ghost number g and the picture number p are assigned as in table 1. The total superconformal field theory on the world-sheet is constructed from the fields X^μ, ψ^μ, b, c, ξ, η, and ϕ. Their fundamental operator product expansions (OPEs) and mode expansions in the NS sector are given by[29]

$$X^\mu(z_1,\overline{z_1})X^\nu(z_2,\overline{z_2}) \sim -\eta^{\mu\nu}\Big(\ln|z_1-z_2|^2 + \ln|z_1-\overline{z_2}|^2\Big), \quad \partial X^\mu(z) = -\mathrm{i}\sum_{n\in\mathbb{Z}}\frac{\alpha_n^\mu}{z^{n+1}}\,, \tag{A.2a}$$

$$\psi^\mu(z_1)\psi^\nu(z_2) \sim \frac{\eta^{\mu\nu}}{z_{12}}\,, \quad \psi^\mu(z) = \sum_{r\in\mathbb{Z}+1/2}\frac{\psi_r^\mu}{z^{r+1/2}}\,, \tag{A.2b}$$

$$b(z_1)c(z_2) \sim \frac{1}{z_{12}}\,, \quad b(z) = \sum_{n\in\mathbb{Z}}\frac{b_n}{z^{n+2}}\,, \quad c(z) = \sum_{n\in\mathbb{Z}}\frac{c_n}{z^{n-1}}\,, \tag{A.2c}$$

$$\xi(z_1)\eta(z_2) \sim \frac{1}{z_{12}}\,, \quad \xi(z) = \sum_{n\in\mathbb{Z}}\frac{\xi_n}{z^n}\,, \quad \eta(z) = \sum_{n\in\mathbb{Z}}\frac{\eta_n}{z^{n+1}}\,, \tag{A.2d}$$

Table 1: The quantum number (g,p) and the conformal weight h.

operator	b	c	ξ	η	$\mathrm{e}^{l\phi}$	j_B	d	f
(g,p)	$(-1,0)$	$(1,0)$	$(-1,1)$	$(1,-1)$	$(0,l)$	$(1,0)$	$(-1,1)$	$(1,-1)$
h	2	-1	0	1	$-\frac{1}{2}l(l+2)$	1	2	-1

---

[28] We omit the normal ordering symbol with respect to the SL(2,$\mathbb{R}$)-invariant vacuum.

[29] Basically, we follow the convention in refs. [39, 40], setting $\alpha' = 2$.

$$\phi(z_1)\phi(z_2) \sim -\ln z_{12}\,, \quad \partial\phi(z) = -\sum_{n\in\mathbb{Z}} \frac{\phi_n}{z^{n+1}}\,, \tag{A.2e}$$

with $z_{12} := z_1 - z_2$, and the symbol "$\sim$" denoting the equality up to non-singular terms. Note the factor of $-\mathrm{i}$ and of -1 in the mode expansions in eqs. (A.2a) and (A.2e). In what follows, unless otherwise stated, an operator $\mathcal{O}$ of conformal weight h will be expanded as in eqs. (A.2b)-(A.2d):

$$\mathcal{O}(z) = \sum_n \frac{\mathcal{O}_n}{z^{n+h}}\,, \quad \mathcal{O}_n = \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}} z^{n+h-1}\mathcal{O}(z)\,. \tag{A.3}$$

Here we have used the doubling trick [39], and have denoted by C a counterclockwise contour encircling the origin. The BPZ conjugate of $\mathcal{O}_n$ is defined as

$$\mathrm{bpz}(\mathcal{O}_n) := \oint_{C'} \frac{\mathrm{d}z'}{2\pi\mathrm{i}} (z')^{n+h-1}\mathcal{O}'(z')\,, \tag{A.4}$$

where $\mathcal{O}'$ is a conformal transform of $\mathcal{O}$ by the inversion $z \mapsto z' = -\frac{1}{z}$, and C' is a counterclockwise contour encircling the origin of the z'-plane. In particular, if $\mathcal{O}$ is a primary operator, we have

$$\mathcal{O}'(z') = \left(\frac{\mathrm{d}z'}{\mathrm{d}z}\right)^{-h} \mathcal{O}(z)\,, \tag{A.5}$$

so that

$$\mathrm{bpz}(\mathcal{O}_n) = (-1)^{n+h}\mathcal{O}_{-n}\,. \tag{A.6}$$

The BPZ conjugate of the product of the operators A and B is given by

$$\mathrm{bpz}(AB) = (-1)^{\epsilon(A)\epsilon(B)}\mathrm{bpz}(B)\,\mathrm{bpz}(A)\,, \tag{A.7}$$

with $\epsilon(A)$ and $\epsilon(B)$ denoting the Grassmann parity of A and of B.

Under the bosonization (A.1), the BRST current j_B takes the form

$$\begin{aligned} j_B &= cT^{\mathrm{m}} + \gamma G^{\mathrm{m}} + bc\partial c + \frac{3}{4}(\partial c)\beta\gamma + \frac{1}{4}c(\partial\beta)\gamma - \frac{3}{4}c\beta\partial\gamma - b\gamma^2 + \frac{3}{4}\partial^2 c \\ &= cT^{\mathrm{m}} + \eta e^{\phi} G^{\mathrm{m}} + bc\partial c + \frac{3}{4}\partial c\partial\phi - \frac{1}{4}c\partial^2\phi - \frac{1}{2}c\partial\phi\partial\phi - c\eta\partial\xi - b\eta\partial\eta e^{2\phi} + \frac{3}{4}\partial^2 c\,, \end{aligned} \tag{A.8}$$

where T^{m} and G^{m} are the matter energy-momentum tensor and the matter supercurrent, respectively:

$$T^{\mathrm{m}} = -\frac{1}{2}\partial X^{\mu}\partial X_{\mu} - \frac{1}{2}\psi^{\mu}\partial\psi_{\mu}\,, \quad G^{\mathrm{m}} = \mathrm{i}\psi^{\mu}\partial X_{\mu}\,. \tag{A.9}$$

We have added the total-derivative term $\frac{3}{4}\partial^2 c$, in order to make the current primary. The BRST operator $Q = \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}} j_B(z)$ and the zero mode of η anticommute with each other, and thus we have

$$Q^2 = \eta_0^2 = \{Q, \eta_0\} = 0\,. \tag{A.10}$$

By contrast, the anticommutator of Q and ξ produces the picture-changing operator

$$X := \{Q, \xi\} = e^{\phi}G^{\mathrm{m}} + c\partial\xi + b\partial\eta e^{2\phi} + \partial\big(b\eta e^{2\phi}\big)\,. \tag{A.11}$$

It obeys the following operator product expansions:

$$X(z_1)b(z_2) \sim -\frac{1}{z_{12}}\partial\xi(z_2)\,, \tag{A.12a}$$

$$X(z_1)c(z_2) \sim \frac{1}{z_{12}^2}\eta\,\mathrm{e}^{2\phi}(z_2) - \frac{1}{z_{12}}\partial\eta\,\mathrm{e}^{2\phi}(z_2)\,, \tag{A.12b}$$

$$X(z_1)\xi(z_2) \sim -\frac{2}{z_{12}^2}b\,\mathrm{e}^{2\phi}(z_2) - \frac{1}{z_{12}}\partial\big(b\,\mathrm{e}^{2\phi}\big)(z_2)\,, \tag{A.12c}$$

$$X(z_1)\eta(z_2) \sim -\frac{1}{z_{12}^2}c(z_2) - \frac{1}{z_{12}}\partial c(z_2)\,. \tag{A.12d}$$

As a result, we obtain

$$[X_m, b_n] = (m+n)\xi_{m+n}\,, \tag{A.13a}$$

$$[X_m, \xi_n] = -(m-n)\big(b\,\mathrm{e}^{2\phi}\big)_{m+n}\,, \tag{A.13b}$$

$$[X_m, \eta_0] = 0\,. \tag{A.13c}$$

Next let us see the properties of the primary operator

$$d := [Q, b\xi] = T\xi - bX + \partial^2\xi\,, \tag{A.14}$$

where T is the total energy-momentum tensor:

$$T = T^{\mathrm{m}} + T^{bc} + T^{\eta\xi} + T^{\phi}\,, \quad T(z) = \sum_{n\in\mathbb{Z}} \frac{L_n}{z^{n+2}}\,, \tag{A.15a}$$

$$T^{bc} = -(\partial b)c - 2b\partial c\,, \quad T^{\eta\xi} = -\eta\partial\xi\,, \quad T^{\phi} = -\frac{1}{2}\partial\phi\partial\phi - \partial^2\phi\,. \tag{A.15b}$$

OPEs of the operator d are

$$d(z_1)b(z_2) \sim \frac{2}{z_{12}^2}\xi b(z_2) + \frac{1}{z_{12}}\partial(\xi b)(z_2)\,, \tag{A.16a}$$

$$d(z_1)c(z_2) \sim -\frac{1}{z_{12}^2}\big[\xi c + b\eta\,\mathrm{e}^{2\phi}\big](z_2) + \frac{1}{z_{12}}\big[-\mathrm{e}^{\phi}G^{\mathrm{m}} + \xi\partial c - (\partial b)\eta\,\mathrm{e}^{2\phi} - \partial\big(b\eta\,\mathrm{e}^{2\phi}\big)\big](z_2)\,, \tag{A.16b}$$

$$d(z_1)\xi(z_2) \sim \frac{1}{z_{12}}\big[\xi\partial\xi - b(\partial b)\,\mathrm{e}^{2\phi}\big](z_2)\,, \tag{A.16c}$$

$$d(z_1)\eta(z_2) \sim \frac{2}{z_{12}^3} + \frac{1}{z_{12}^2}\big[bc + \xi\eta\big](z_2) + \frac{1}{z_{12}}\big[T + \partial(bc) + \partial(\xi\eta)\big](z_2)\,, \tag{A.16d}$$

$$d(z_1)d(z_2) \sim 0\,. \tag{A.16e}$$

Thus we obtain

$$\{d_m, b_n\} = (m-n)(\xi b)_{m+n}\,, \tag{A.17a}$$

$$\{d_m, \eta_0\} = L_m\,, \tag{A.17b}$$

$$\{d_m, d_n\} = 0\,. \tag{A.17c}$$

Note that eq. (A.17b) is analogous to $\{b_m, Q\} = L_m$. In fact, η_0 and d_0 are the counterparts of Q and b_0 in the twisted $N = 2$ superconformal algebra in ref. [29], and the following equations hold:

$$\Big[\, b_0\,,\, \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}}\frac{c\eta}{z} \,\Big] = \eta_0\,, \tag{A.18a}$$

$$\Big[\, d_0\,,\, \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}}\frac{c\eta}{z} \,\Big] = -Q\,, \tag{A.18b}$$

$$\Big[\, \eta_0\,,\, \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}} z\,(b\xi) \,\Big] = -b_0\,, \tag{A.18c}$$

$$\{\eta_0\,,\, d_0\} = L_0\,. \tag{A.18d}$$

These relations form the diagrams in figure 2. Moreover, the weight-(-1) operator

$$f := -c\partial c\xi\,\mathrm{e}^{-2\phi} = -\Big[Q\,,\, c\xi\,\mathrm{e}^{-2\phi}\Big] \tag{A.19}$$

satisfies

$$\{d_m, f_n\} = \delta_{m+n,0}\,, \tag{A.20}$$

which corresponds to the equation $\{b_m, c_n\} = \delta_{m+n,0}$.

We list the relevant relations among the zero modes in table 2. Throughout the present paper, we often use the symbol ζ_0, which denotes either ξ_0 or d_0. We also introduce the following barred operators in section 4.1 and appendix C:

$$\overline{L}_0 := \{\eta_0, \zeta_0\} = \begin{cases} 1 & (\text{for } \zeta_0 = \xi_0) \\ L_0 & (\text{for } \zeta_0 = d_0) \end{cases}\,, \quad L_{x,y} := xL_0 + y\overline{L}_0 = \begin{cases} xL_0 + y & (\text{for } \zeta_0 = \xi_0) \\ (x+y)\,L_0 & (\text{for } \zeta_0 = d_0) \end{cases}\,, \tag{A.21}$$

$$\overline{\zeta}_0 := \begin{cases} \xi_0 & (\text{for } \zeta_0 = \xi_0) \\ \dfrac{d_0}{L_0} & (\text{for } \zeta_0 = d_0) \end{cases}\,, \quad \overline{c}_0 := \begin{cases} c_0 & (\text{for } \zeta_0 = \xi_0) \\ \dfrac{Q}{L_0} & (\text{for } \zeta_0 = d_0) \end{cases}\,, \quad \overline{\eta}_0 := \begin{cases} \eta_0 & (\text{for } \zeta_0 = \xi_0) \\ \dfrac{\eta_0}{L_0} & (\text{for } \zeta_0 = d_0) \end{cases}\,, \tag{A.22}$$

$$\begin{tikzcd}
 & \oint_C \frac{\mathrm{d}z}{2\pi\mathrm{i}}\frac{c\eta}{z} \arrow[dl, "{[\; b_0\;,\;\cdot\;]}"'] \arrow[dr, "{[\;\cdot\;,\; d_0\;]}"] & \\
\eta_0 & & Q
\end{tikzcd}
\qquad
\begin{tikzcd}

\end{tikzcd}$$

Figure 2: Diagrams.

Table 2: Relevant relations among the zero modes. In each box, the value of the graded commutator $[A, B\}$ of an operator A in the first column and B in the first row is shown. Some nonzero results whose explicit forms are not used in the present paper are omitted.

B A	Q	η_0	b_0	ξ_0	d_0	c_0	X_0
Q	0	0	L_0	X_0	0		0
η_0	0	0	0	1	L_0	0	0
b_0	L_0	0	0	0	0	1	0
ξ_0	X_0	1	0	0		0	0
d_0	0	L_0	0		0		
c_0		0	1	0		0	
X_0	0	0	0	0			0

$$\overline{X}_0 := \{Q\,,\,\overline{\zeta}_0\} = \begin{cases} X_0 \quad \big(\text{for } \zeta_0 = \xi_0\big) \\ 0 \quad \big(\text{for } \zeta_0 = d_0\big) \end{cases} . \tag{A.23}$$

They obey the equations below

$$b_0^2 = \overline{c}_0^2 = \zeta_0^2 = \overline{\zeta}_0^2 = \eta_0^2 = \overline{\eta}_0^2 = 0\,, \tag{A.24}$$

$$\{b_0, \overline{c}_0\} = \{\zeta_0, \overline{\eta}_0\} = \{\overline{\zeta}_0, \eta_0\} = 1\,, \tag{A.25}$$

$$\{b_0, \zeta_0\} = \{b_0, \overline{\zeta}_0\} = \{b_0, \overline{\eta}_0\} = \{\overline{c}_0, \zeta_0\} = \{\overline{c}_0, \overline{\eta}_0\} = 0\,, \tag{A.26}$$

$$\{Q, \overline{\eta}_0\} = 0\,, \quad \{Q, \overline{\zeta}_0\} = \overline{X}_0\,. \tag{A.27}$$

B Hermitian conjugation and the reality condition

We consider the reality of the action and of component fields in the WZW-type open superstring field theory. First we introduce Hermitian conjugation of mode operators, and then investigate the reality condition [38] in the same manner as in appendix C of ref. [28].

B.1 Hermitian conjugation of mode operators

We define Hermitian conjugation (hc) of the mode operators α_n^μ, ψ_r^μ, b_n, c_n, ξ_n, and η_n in eq. (A.2) as

$$\mathrm{hc}(\alpha_n^\mu) = \alpha_{-n}^\mu\,, \quad \mathrm{hc}(\psi_r^\mu) = \psi_{-r}^\mu\,, \tag{B.1a}$$

$$\mathrm{hc}(b_n) = b_{-n}\,, \quad \mathrm{hc}(c_n) = c_{-n}\,, \tag{B.1b}$$

$$\mathrm{hc}(\xi_n) = \xi_{-n}\,, \quad \mathrm{hc}(\eta_n) = \eta_{-n}\,. \tag{B.1c}$$

The Hermitian conjugate of the product of the operators A and B is given by

$$\mathrm{hc}(AB) = \mathrm{hc}(B)\,\mathrm{hc}(A)\ . \tag{B.2}$$

Under the above definitions, the energy-momentum tensors T^{m}, T^{bc}, and $T^{\eta\xi}$ in eqs. (A.9) and (A.15) are Hermitian in the following sense:

$$\mathrm{hc}\big(L_n^{\mathrm{m}}\big) = L_{-n}^{\mathrm{m}}\,, \quad \mathrm{hc}\big(L_n^{bc}\big) = L_{-n}^{bc}\,, \quad \mathrm{hc}\big(L_n^{\eta\xi}\big) = L_{-n}^{\eta\xi}\,, \tag{B.3}$$

where L_n^{m}, L_n^{bc}, and $L_n^{\eta\xi}$ are mode operators of T^{m}, T^{bc}, and $T^{\eta\xi}$, respectively. We require that the same relation hold also for the mode operators L_n^{ϕ} of the other energy-momentum tensor T^{ϕ}: $\mathrm{hc}\big(L_n^{\phi}\big) = L_{-n}^{\phi}$. This requirement determines the Hermitian conjugates of ϕ_n; we find that

$$\mathrm{hc}(\phi_n) = \begin{cases} -\,\phi_{-n} & (n \neq 0)\,, \\ -\,\phi_0 - 2 & (n = 0)\,. \end{cases} \tag{B.4}$$

The transformation property of the zero mode ϕ_0 reflects the fact that the current $j^{\phi} = -\partial\phi$ is not primary and the ϕ-charge is anomalous. As we shall see in the next subsection, the shift of $-\phi_0$ by -2 is consistent with the definition of the inner product (B.24).

In order to go further, let us expand also the operator $\mathrm{e}^{l\phi}$ $(l \in \mathbb{Z})$ in the following form:

$$\mathrm{e}^{l\phi(z)} = \sum_{r \in \mathbb{Z}+l/2} \frac{e_r^l}{z^{r+h_l}}\,, \tag{B.5}$$

where $h_l := -\frac{1}{2}l(l+2)$ is the conformal weight of $\mathrm{e}^{l\phi}$. The superscript l on the mode operators indicates their ϕ-charge, and we have

$$\big[\phi_0, e_r^l\big] = l\, e_r^l\,. \tag{B.6}$$

Note that if l is even (resp. odd), the operators e_r^l are bosonic (resp. fermionic). We assume

$$\mathrm{hc}\big(e_r^l\big) = \varepsilon_l\, e_{-r}^l \qquad \left(r \in \mathbb{Z} + \frac{l}{2}\right) \tag{B.7}$$

with ε_l a sign factor dependent only on l. We would like to know whether ε_l is plus one or minus one. For this purpose, we consider (anti)commutation relations among e_r^l. By using the identity

$$\mathrm{e}^{l_1\phi(z_1)}\,\mathrm{e}^{l_2\phi(z_2)} = z_{12}^{-l_1 l_2}\,\mathrm{e}^{l_1\phi(z_1)+l_2\phi(z_2)}\,, \tag{B.8}$$

we readily obtain

$$\big\{e_{r_1}^{\pm 1}, e_{r_2}^{\pm 1}\big\} = e_{r_1+r_2}^{\pm 2}\,, \tag{B.9}$$

$$\big[e_{r_1}^{1}, e_{r_2}^{2}\big] = -\sum_{n\in\mathbb{Z}} {}^{\star}_{\star}\,\phi_n e^3_{r_1+r_2-n}\,{}^{\star}_{\star} + \left(r_1 - \frac{5}{2}\right) e^3_{r_1+r_2}\,, \tag{B.10}$$

$$\big[e_{r_2}^{2}, e_{r_1}^{1}\big] = -2\sum_{n\in\mathbb{Z}} {}^{\star}_{\star}\,\phi_n e^3_{r_1+r_2-n}\,{}^{\star}_{\star} + (r_2 - 5)\, e^3_{r_1+r_2}\,, \tag{B.11}$$

$$\big[e_{r_1}^{-1}, e_{r_2}^{-2}\big] = \sum_{n\in\mathbb{Z}} {}^{\star}_{\star}\,\phi_n e^{-3}_{r_1+r_2-n}\,{}^{\star}_{\star} + \left(r_1 - \frac{1}{2}\right) e^{-3}_{r_1+r_2}\,, \tag{B.12}$$

$$\big[e_{r_2}^{-2}, e_{r_1}^{-1}\big] = 2\sum_{n\in\mathbb{Z}} {}^{\star}_{\star}\,\phi_n e^{-3}_{r_1+r_2-n}\,{}^{\star}_{\star} + (r_2 - 1)\, e^{-3}_{r_1+r_2}\,. \tag{B.13}$$

Here we have explicitly written the normal ordering symbol $\star\!\!\star\cdots\star\!\!\star$ with respect to the SL$(2,\mathbb{R})$-invariant vacuum.

First, from eq. (B.9), we find that $\varepsilon_{\pm 2}$ are plus one because we have

$$\mathrm{hc}\big(e^{\pm 2}_{r_1+r_2}\big) = \mathrm{hc}\big(\{e^{\pm 1}_{r_1}, e^{\pm 1}_{r_2}\}\big) = \{e^{\pm 1}_{-r_1}, e^{\pm 1}_{-r_2}\} = e^{\pm 2}_{-r_1-r_2} \,. \tag{B.14}$$

The sign factors $\varepsilon_{\pm 1}$, unlike $\varepsilon_{\pm 2}$, cannot be determined only from the relations (B.9). However, Hermiticity of the BRST operator Q entails

$$\varepsilon_1 = -1\,, \quad \mathrm{hc}\big(e^1_r\big) = -e^1_{-r} \,. \tag{B.15}$$

Furthermore, we can determine ε_{-1} by requiring the consistency with the commutation relation

$$\big[\gamma_s, \beta_r\big] = \delta_{r+s,0} \quad \left(r, s \in \mathbb{Z} + \frac{1}{2}\right), \tag{B.16}$$

where β_r and γ_s are mode operators of the superconformal ghosts. In the bosonized description (A.1), we have

$$\beta_r = -\sum_{n\in\mathbb{Z}} n\, e^{-1}_{r-n}\xi_n \,, \quad \gamma_s = \sum_{n\in\mathbb{Z}} \eta_n e^1_{s-n} \,, \tag{B.17}$$

and eqs. (B.1c) and (B.15) tell us that $\mathrm{hc}(\gamma_s) = +\gamma_{-s}$. Thus, in order for the Hermitian conjugation to be consistent with eq. (B.16), β_r have to transform as $\mathrm{hc}(\beta_r) = -\beta_{-r}$; we conclude that ε_{-1} has to be minus one.

Next, let us consider eqs. (B.10) and (B.11). Comparing these two equations, we obtain

$$\sum_{n\in\mathbb{Z}} {}^\star_\star\, \phi_n e^3_{r_1+r_2-n}\, {}^\star_\star = \frac{1}{3}\left(r_1 + r_2 - \frac{15}{2}\right) e^3_{r_1+r_2} \tag{B.18}$$

and thus

$$\big[e^1_{r_1}, e^2_{r_2}\big] = \frac{1}{3}\,(2r_1 - r_2)\, e^3_{r_1+r_2} \,. \tag{B.19}$$

Similarly, it follows from eqs. (B.12) and (B.13) that

$$\big[e^{-1}_{r_1}, e^{-2}_{r_2}\big] = \frac{1}{3}\,(2r_1 - r_2)\, e^{-3}_{r_1+r_2} \,. \tag{B.20}$$

The conjugation (B.7) is compatible with eqs. (B.19) and (B.20) only when $\varepsilon_{\pm 3}$ are minus one. In this manner, we can determine ε_l, and the result is

$$\varepsilon_l = (-1)^l\,, \quad \mathrm{hc}\big(e^l_r\big) = (-1)^l\, e^l_{-r} \,. \tag{B.21}$$

B.2 The reality condition

The string field $\Phi_{(0,0)}$ is expanded in terms of first-quantized states as

$$\Phi_{(0,0)} = \int \frac{\mathrm{d}^{10}k}{(2\pi)^{10}} \sum_s \sum_l \varphi_l^s(k)\, |s(l;k)\rangle\,. \tag{B.22}$$

Here $|s(l;k)\rangle$ denote basis states of the GSO-even NS Fock space of $(g,p)=(0,0)$, and $\varphi_l^s(k)$ denote component fields of momentum k. The states $|s(l;k)\rangle$ are constructed from coherent states of the form

$$|l;k\rangle := \lim_{z\to 0} \mathrm{e}^{l\phi(z)}\,\mathrm{e}^{\mathrm{i}k\cdot X(z,\overline{z})}\,|0\rangle = \lim_{z\to 0} \mathrm{e}^{\mathrm{i}k\cdot X(z,\overline{z})}\ e^l_{\frac{1}{2}l(l+2)}\,|0\rangle \quad (l\in\mathbb{Z}) \tag{B.23}$$

and mode operators in eq. (A.2). (We have utilized the mode expansion (B.5) in the last equality of eq. (B.23).) In the above definition (B.23), the symbol $|0\rangle$ represents the SL(2,$\mathbb{R}$)-invariant vacuum. In order to investigate the reality of $\langle \Phi_{(0,0)}, Q\eta_0\Phi_{(0,0)}\rangle$, we introduce the Hermitian conjugate $\langle\langle l;k| = \mathrm{hc}\,(\,|l;k\rangle\,)$ satisfying the equation

$$\langle\langle l;k|\,\xi_0 c_{-1}c_0c_1\,|l';k'\rangle = (-1)^l\, C_N\,\delta^{10}(k-k')\delta_{l+l',-2}\,. \tag{B.24}$$

Here C_N is a normalization constant independent of the ϕ-charge l and the momentum k, and the factor $(-1)^l$ originates from the relation (B.21). The above normalization is consistent with the transformation property of ϕ_0 given in eq. (B.4). Indeed we have

$$\begin{aligned} l'\,\langle\langle l;k|\,\xi_0c_{-1}c_0c_1\,|l';k'\rangle &= \langle\langle l;k|\,\xi_0c_{-1}c_0c_1\big(\phi_0\,|l';k'\rangle\big) \\ &= \big(\,\langle\langle l;k|\,\phi_0\big)\xi_0c_{-1}c_0c_1\,|l';k'\rangle = -\,(l+2)\,\langle\langle l;k|\,\xi_0c_{-1}c_0c_1\,|l';k'\rangle\ . \end{aligned} \tag{B.25}$$

In the last equality, we have used

$$\langle\langle l;k|\,\phi_0 = \mathrm{hc}\big(\,\mathrm{hc}(\phi_0)\,|l;k\rangle\,\big) = \mathrm{hc}\big(\,(-\phi_0-2)\,|l;k\rangle\,\big) = -\,(l+2)\,\langle\langle l;k|\ . \tag{B.26}$$

Note that we may relate $\langle\langle l;k|$ to the BPZ conjugate $\langle l;-k| = \mathrm{bpz}(\,|l;-k\rangle)$ as

$$\langle\langle l;k| = (-1)^l\,\langle l;-k|\ . \tag{B.27}$$

The Kronecker delta $\delta_{l+l',-2}$ in eq. (B.24) owes its origin to the ϕ-charge anomaly. The BPZ conjugate of ϕ_0 takes the same form as the Hermitian conjugate:

$$\mathrm{bpz}(\phi_0) = -\phi_0 - 2\,. \tag{B.28}$$

From eqs. (B.1) and (B.24), it follows that

$$\begin{aligned} (-1)^l\,C_N\,\delta^{10}(k-k')\delta_{l+l',-2} &= \langle\langle l';k'|\,\xi_0c_{-1}c_0c_1\,|l;k\rangle \\ &= -\mathrm{hc}\big(\,\langle\langle l;k|\,\xi_0c_{-1}c_0c_1\,|l';k'\rangle\,\big) = -\,(-1)^l\ \overline{C_N}\ \delta^{10}(k-k')\delta_{l+l',-2}\,. \end{aligned} \tag{B.29}$$

Thus C_N has to be pure imaginary. Let us set $C_N = \frac{\mathrm{i}}{2}(2\pi)^{10}$, in which case we have

$$\langle l;k|\,\xi c\partial c\partial^2 c\,|l';k'\rangle = -\mathrm{i}\,(2\pi)^{10}\,\delta^{10}(k+k')\delta_{l+l',-2}\,. \tag{B.30}$$

Eq. (B.27) tells us that the Hermitian conjugate of $|s(l;k)\rangle$ coincides with the BPZ conjugate of $|s(l;-k)\rangle$ except for some sign factor ε_s:

$$\langle\langle s(l;k)| = \varepsilon_s\,\langle s(l;-k)|\ . \tag{B.31}$$

The factor ε_s depends not on the coherent state (B.23) but only on the mode operators. Using eqs. (B.22) and (B.31), we obtain

$$\begin{aligned}\langle\Phi_{(0,0)}, Q\eta_0\,\Phi_{(0,0)}\rangle &= \int\frac{\mathrm{d}^{10}k}{(2\pi)^{10}}\frac{\mathrm{d}^{10}k'}{(2\pi)^{10}}\sum_{s,s'}\sum_{l,l'}\varphi^{s'}_{l'}(k')\,\langle s'(l';k')|\,Q\eta_0\,|s(l;k)\rangle\,\varphi^{s}_{l}(k)\\ &= \int\frac{\mathrm{d}^{10}k}{(2\pi)^{10}}\frac{\mathrm{d}^{10}k'}{(2\pi)^{10}}\sum_{s,s'}\sum_{l,l'}\varepsilon_{s'}\,\varphi^{s'}_{l'}(k')\,\langle\langle s'(l';-k')|\,Q\eta_0\,|s(l;k)\rangle\,\varphi^{s}_{l}(k)\\ &= \int\frac{\mathrm{d}^{10}k}{(2\pi)^{10}}\frac{\mathrm{d}^{10}k'}{(2\pi)^{10}}\sum_{s,s'}\sum_{l,l'}\varepsilon_{s}\,\varphi^{s}_{l}(-k)\,\langle\langle s(l;k)|\,Q\eta_0\,|s'(l';k')\rangle\,\varphi^{s'}_{l'}(k')\,,\end{aligned} \tag{B.32}$$

$$\begin{aligned}\overline{\langle\Phi_{(0,0)}, Q\eta_0\,\Phi_{(0,0)}\rangle} &= -\int\frac{\mathrm{d}^{10}k}{(2\pi)^{10}}\frac{\mathrm{d}^{10}k'}{(2\pi)^{10}}\sum_{s,s'}\sum_{l,l'}\overline{\varphi^{s}_{l}(k)}\,\langle\langle s(l;k)|\,Q\eta_0\,|s'(l';-k')\rangle\,\varepsilon_{s'}\,\overline{\varphi^{s'}_{l'}(k')}\\ &= -\int\frac{\mathrm{d}^{10}k}{(2\pi)^{10}}\frac{\mathrm{d}^{10}k'}{(2\pi)^{10}}\sum_{s,s'}\sum_{l,l'}\overline{\varphi^{s}_{l}(k)}\,\langle\langle s(l;k)|\,Q\eta_0\,|s'(l';k')\rangle\,\varepsilon_{s'}\,\overline{\varphi^{s'}_{l'}(-k')}\,.\end{aligned} \tag{B.33}$$

Comparing the above two equations, we find that $\langle\Phi_{(0,0)}, Q\eta_0\,\Phi_{(0,0)}\rangle$ *multiplied by an imaginary unit* is real if component fields satisfy

$$\overline{\varphi^{s}_{l}(k)} = -\varepsilon_s\,\varphi^{s}_{l}(-k)\,, \tag{B.34}$$

or equivalently

$$\overline{\varphi^{s}_{l}(x)} = -\varepsilon_s\,\varphi^{s}_{l}(x) \tag{B.35}$$

in the coordinate representation. Condition (B.34) can be expressed in terms of the string field as

$$\Phi^{\ddagger}_{(0,0)} = -\Phi_{(0,0)}\,, \tag{B.36}$$

where ‡ denotes the composition of Hermitian conjugation and the inverse BPZ conjugation (bpz^{-1}):

$$\Phi^{\ddagger}_{(0,0)} := \mathrm{bpz}^{-1}\circ\mathrm{hc}\left(\Phi_{(0,0)}\right). \tag{B.37}$$

It should be mentioned that the other possibility $\Phi^{\ddagger}_{(0,0)} = +\Phi_{(0,0)}$ ($\Longleftrightarrow \overline{\varphi^{s}_{l}(k)} = +\varepsilon_s\,\varphi^{s}_{l}(-k)$) is excluded when we consider the interacting theory: only condition (B.36) is compatible with the equation of motion

$$\eta_0\left(\mathrm{e}^{-\Phi_{(0,0)}}\,Q\,\mathrm{e}^{\Phi_{(0,0)}}\right) = 0 \tag{B.38}$$

because we have

$$\eta_0\big(\mathrm{e}^{-\Phi_{(0,0)}}\,Q\,\mathrm{e}^{\Phi_{(0,0)}}\big)=0 \iff 0=\Big(\eta_0\big(\mathrm{e}^{-\Phi_{(0,0)}}\,Q\,\mathrm{e}^{\Phi_{(0,0)}}\big)\Big)^{\ddagger}=-\eta_0\Big(\big(Q\,\mathrm{e}^{\Phi^{\ddagger}_{(0,0)}}\big)\,\mathrm{e}^{-\Phi^{\ddagger}_{(0,0)}}\Big)\,. \tag{B.39}$$

Here we have used the relations

$$(Q\Phi)^{\ddagger}=-(-1)^{\epsilon(\Phi)}Q\Phi^{\ddagger}\,,\quad (\eta_0\Phi)^{\ddagger}=-(-1)^{\epsilon(\Phi)}\eta_0\Phi^{\ddagger}\,,\quad (\Phi\Psi)^{\ddagger}=\Psi^{\ddagger}\Phi^{\ddagger}\,, \tag{B.40}$$

where Φ and Ψ are string fields, and $\epsilon(\Phi)$ denotes the Grassmann parity of Φ.

In summary, in order for the action to be real, we have to consider not $\langle\Phi_{(0,0)},Q\eta_0\Phi_{(0,0)}\rangle$ but $\mathrm{i}\times\langle\Phi_{(0,0)},Q\eta_0\Phi_{(0,0)}\rangle$ with $\Phi_{(0,0)}$ satisfying the reality condition (B.36). One should note that in our convention, in which Q and η_0 are Hermitian, the operator $Q\eta_0$ is not Hermitian but $\mathrm{i}\times Q\eta_0$ is. The sign factor ε_s for the state

$$\begin{aligned}|s(l;k)\rangle=\big(\alpha^{\mu_1}_{-k_1}\cdots\alpha^{\mu_i}_{-k_i}\big)\big(\psi^{\nu_1}_{-r_1}\cdots\psi^{\nu_j}_{-r_j}\big)\big(b_{-\ell_1}\cdots b_{-\ell_q}\big)\big(c_{-\ell'_1}\cdots c_{-\ell'_{q'}}\big)&\\ \times\big(\xi_{-m_1}\cdots\xi_{-m_t}\big)\big(\eta_{-m'_1}\cdots\eta_{-m'_{t'}}\big)\big(\phi_{-n_1}\cdots\phi_{-n_a}\big)\,|l;k\rangle&\end{aligned} \tag{B.41}$$

with

$$1\le k_1\le k_2\le\cdots\le k_i\,,\quad \frac{1}{2}\le r_1<r_2<\cdots<r_j\,, \tag{B.42a}$$

$$2\le\ell_1<\ell_2<\cdots<\ell_q\,,\quad -1\le\ell'_1<\ell'_2<\cdots<\ell'_{q'}\,, \tag{B.42b}$$

$$0\le m_1<m_2<\cdots<m_t\,,\quad 1\le m'_1<m'_2<\cdots<m'_{t'}\,,\quad 1\le n_1\le n_2\le\cdots\le n_a\,, \tag{B.42c}$$

$$j+l\in 2\mathbb{Z}\,,\quad -q+q'-t+t'=0\,,\quad t-t'+l=0 \tag{B.43}$$

is explicitly computed as

$$\varepsilon_s=(-1)^{-N+i+\frac{j^2}{2}}\,,\quad N:=\sum_a k_a+\sum_b r_b+\sum_c\ell_c+\sum_{c'}\ell'_{c'}+\sum_d m_d+\sum_{d'}m'_{d'}+\sum_e n_e\,. \tag{B.44}$$

The conditions (B.43) ensure that the state (B.41) is GSO even and is of $(g,p)=(0,0)$.

Consistency with the reality condition (B.36) sets constraints also on the parameters of the gauge transformation (2.3):

$$\Lambda^{\ddagger}_{(-1,0)}=-\Lambda_{(-1,0)}\,,\quad \Lambda^{\ddagger}_{(-1,1)}=-\Lambda_{(-1,1)}\,. \tag{B.45}$$

These constraints follow immediately from the first two relations in eq. (B.40).

C Proofs of propositions 4.1 and 4.3

In the present appendix, we give proofs of propositions 4.1 and 4.3, which guarantee the reachability of conditions (4.12) and (4.13). In what follows, we utilize the relations (A.21)-(A.27).

Proposition 4.1 bis *For any set of string fields of the form* $\{\Phi_{(-n,m)} \mid 0 \leq m \leq n\}$ *($n \geq 0$ is fixed), there exists a set of string fields* $\{\Lambda_{(-(n+1),m)} \mid 0 \leq m \leq n+1\}$ *such that*

$$\boldsymbol{B}^{\zeta_0;x,y}_{n+2,n+1}\Big(\boldsymbol{\Phi}_{-n} + \boldsymbol{Q}_{n+1,n+2}\boldsymbol{\Lambda}_{-(n+1)}\Big) = 0 \quad (n \geq 0)\,. \tag{4.14 bis}$$

Proof. Eq. (4.14) is equivalent to the following set of equations:

$$b_0\big(\Phi_{(-n,0)} + Q\Lambda_{(-(n+1),0)}\big) + b_0\eta_0\Lambda_{(-(n+1),1)} = 0 \quad (n \geq 0)\,, \tag{C.1a}$$

$$\begin{aligned} &y\zeta_0\Big(\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) + \eta_0\Lambda_{(-(n+1),m+1)}\Big) + xb_0\big(\Phi_{(-n,m+1)} + Q\Lambda_{(-(n+1),m+1)}\big) \\ &\quad + xb_0\eta_0\Lambda_{(-(n+1),m+2)} = 0 \quad (0 \leq m \leq n-1)\,, \end{aligned} \tag{C.1b}$$

$$\zeta_0\Big(\big(\Phi_{(-n,n)} + Q\Lambda_{(-(n+1),n)}\big) + \eta_0\Lambda_{(-(n+1),n+1)}\Big) = 0 \quad (n \geq 0)\,. \tag{C.1c}$$

(I) $x = 0$ (and $y \neq 0$) case

For the purpose of showing the existence of the solution to eq. (C.1), it is sufficient to find $\Lambda_{(-(n+1),m)}$ ($0 \leq n$, $0 \leq m \leq n+1$) such that

$$b_0\big(\Phi_{(-n,0)} + Q\Lambda_{(-(n+1),0)}\big) = 0\,, \quad b_0\eta_0\Lambda_{(-(n+1),1)} = 0 \quad (n \geq 0)\,, \tag{C.2a}$$

$$\zeta_0\Big(\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) + \eta_0\Lambda_{(-(n+1),m+1)}\Big) = 0 \quad (0 \leq m \leq n)\,. \tag{C.2b}$$

These equations are solved by

$$\Lambda_{(-(n+1),0)} = -\frac{b_0}{L_0}\Phi_{(-n,0)} \quad (n \geq 0)\,, \tag{C.3a}$$

$$\Lambda_{(-(n+1),m+1)} = -\overline{\zeta}_0\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) \quad (0 \leq m \leq n) \tag{C.3b}$$

with

$$\overline{\zeta}_0 := \begin{cases} \xi_0 & (\text{for } \zeta_0 = \xi_0)\,, \\ \dfrac{d_0}{L_0} & (\text{for } \zeta_0 = d_0)\,. \end{cases} \tag{C.4}$$

Indeed, given eq. (C.3), we have

$$\Phi_{(-n,0)} + Q\Lambda_{(-(n+1),0)} = \frac{b_0 Q}{L_0}\Phi_{(-n,0)} \quad (n \geq 0)\,, \tag{C.5a}$$

$$\Lambda_{(-(n+1),1)} = -\frac{\overline{\zeta}_0 b_0 Q}{L_0}\Phi_{(-n,0)}\,, \quad b_0\eta_0\Lambda_{(-(n+1),1)} = 0 \quad (n \geq 0)\,, \tag{C.5b}$$

$$\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) + \eta_0\Lambda_{(-(n+1),m+1)} = \overline{\zeta}_0\eta_0\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) \quad (0 \leq m \leq n)\,. \tag{C.5c}$$

(II) $x \neq 0$ case

It is sufficient to show the existence of $\Lambda_{(-(n+1),m)}$ ($0 \leq n$, $0 \leq m \leq n+1$) such that

$$\mathbf{Eq}_{-(n+1),0}: \quad b_0\big(\Phi_{(-n,0)} + Q\Lambda_{(-(n+1),0)}\big) = 0 \qquad (n \geq 0)\,, \tag{C.6a}$$

$\mathbf{Eq_{-(n+1),m+1}}$:

$$\begin{cases} b_0\eta_0\Lambda_{(-(n+1),m+1)} = 0 \\ y\zeta_0\Big(\big(\Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\big) + \eta_0\Lambda_{(-(n+1),m+1)}\Big) + x b_0\big(\Phi_{(-n,m+1)} + Q\Lambda_{(-(n+1),m+1)}\big) = 0 \end{cases}$$

$$(0 \le m \le n-1)\,, \tag{C.6b}$$

$$\mathbf{Eq_{-(n+1),n+1}}: \quad \begin{cases} b_0\eta_0\Lambda_{(-(n+1),n+1)} = 0 \\ \zeta_0\Big(\big(\Phi_{(-n,n)} + Q\Lambda_{(-(n+1),n)}\big) + \eta_0\Lambda_{(-(n+1),n+1)}\Big) = 0 \end{cases} \qquad (n \ge 0)\,. \tag{C.6c}$$

If $n = 0$, eq. (C.6) is the same as eq. (C.2). Therefore we concentrate on the case in which $n \ge 1$. Noting that $\mathbf{Eq_{-(n+1),0}}$ $(n \ge 1)$ is solved by the choice

$$\Lambda_{(-(n+1),0)} = -\frac{b_0}{L_0}\Phi_{(-n,0)} \qquad (n \ge 1)\,, \tag{C.7}$$

we find that the following lemma ensures the existence of the solution to eq. (C.6). □

Lemma C.1 *Let $n \ge 1$ be fixed, and let x be nonzero. If $\mathbf{Eq_{-(n+1),m}}$ holds for some m $(0 \le \exists m \le n)$, then there exists $\Lambda_{(-(n+1),m+1)}$ which solves $\mathbf{Eq_{-(n+1),m+1}}$.*

Proof. By the use of the relation

$$\{b_0, \overline{c}_0\} = \{\zeta_0, \overline{\eta}_0\} = 1 \tag{C.8}$$

with

$$\overline{c}_0 := \begin{cases} c_0 & (\text{for } \zeta_0 = \xi_0) \\ \dfrac{Q}{L_0} & (\text{for } \zeta_0 = d_0) \end{cases}, \quad \overline{\eta}_0 := \begin{cases} \eta_0 & (\text{for } \zeta_0 = \xi_0) \\ \dfrac{\eta_0}{L_0} & (\text{for } \zeta_0 = d_0) \end{cases}, \tag{C.9}$$

one can decompose any string field $\Phi_{(g,p)}$ of world-sheet ghost number g and picture number p as[30]

$$\Phi_{(g,p)} = \overline{c}_0\zeta_0\,\Phi^{\overline{c}\zeta}_{(g,p)} + \overline{c}_0\,\Phi^{\overline{c}-}_{(g,p)} + \zeta_0\,\Phi^{-\zeta}_{(g,p)} + \Phi^{--}_{(g,p)} \tag{C.10}$$

with

$$\Phi^{\overline{c}\zeta}_{(g,p)} = \overline{\eta}_0 b_0 \Phi_{(g,p)}\,, \quad \Phi^{\overline{c}-}_{(g,p)} = \overline{\eta}_0\zeta_0 b_0 \Phi_{(g,p)}\,, \quad \Phi^{-\zeta}_{(g,p)} = \overline{\eta}_0 b_0 \overline{c}_0 \Phi_{(g,p)}\,, \quad \Phi^{--}_{(g,p)} = \overline{\eta}_0\zeta_0 b_0 \overline{c}_0 \Phi_{(g,p)}\,. \tag{C.11}$$

It should be noted that the subscripts on $\Phi^{\overline{c}\zeta}_{(g,p)}$, $\Phi^{\overline{c}-}_{(g,p)}$, $\Phi^{-\zeta}_{(g,p)}$, and $\Phi^{--}_{(g,p)}$ are simply carried over from $\Phi_{(g,p)}$, and thus they do not necessarily indicate the quantum numbers of the string fields. Indeed, whereas $\Phi^{--}_{(g,p)}$ is of quantum number (g,p), the other fields $\Phi^{\overline{c}\zeta}_{(g,p)}$, $\Phi^{\overline{c}-}_{(g,p)}$, and $\Phi^{-\zeta}_{(g,p)}$ *are not*: their quantum numbers are $(g,p-1)$, $(g-1,p)$, and $(g+1,p-1)$, respectively. All of the string fields

---

[30] Properties of the barred operators are given at the end of appendix A.

$\Phi^{\overline{c}\zeta}_{(g,p)}$, $\Phi^{\overline{c}-}_{(g,p)}$, $\Phi^{-\zeta}_{(g,p)}$, and $\Phi^{--}_{(g,p)}$ are annihilated by both b_0 and η_0.

The equations $\mathbf{Eq}_{\boldsymbol{-(n+1),m}}$ and $b_0\eta_0\Lambda_{(-(n+1),m+1)} = 0$ $(0 \leq m \leq n)$ respectively imply

$$\widetilde{\Phi}^{\overline{c}-}_{(-n,m)} = 0 \quad \text{(this follows from } \ \zeta_0 b_0 \widetilde{\Phi}_{(-n,m)} = 0) \tag{C.12}$$

and

$$\Lambda^{\overline{c}\zeta}_{(-(n+1),m+1)} = 0\,. \tag{C.13}$$

Here we have defined $\widetilde{\Phi}_{(-n,m)}$ $(0 \leq m \leq n)$ as

$$\widetilde{\Phi}_{(-n,m)} := \Phi_{(-n,m)} + Q\Lambda_{(-(n+1),m)}\,. \tag{C.14}$$

Our proof of the lemma is composed of two parts.

(I) $\mathbf{Eq}_{\boldsymbol{-(n+1),m}}$ $\quad (0 \leq \exists m \leq n-1) \implies \exists\Lambda_{(-(n+1),m+1)}$, s.t. $\mathbf{Eq}_{\boldsymbol{-(n+1),m+1}}$ holds.

We seek $\Lambda_{(-(n+1),m+1)}$ such that

$$y\zeta_0\left(\widetilde{\Phi}_{(-n,m)} + \eta_0\Lambda_{(-(n+1),m+1)}\right) + xb_0\left(\Phi_{(-n,m+1)} + Q\Lambda_{(-(n+1),m+1)}\right) = 0\,, \tag{C.15}$$

under conditions (C.12) and (C.13). This suffices to prove claim (I). Substituting eqs. (C.12) and (C.13) into eq. (C.15), we obtain

$$\begin{aligned}&\zeta_0\Big[\big(y\widetilde{\Phi}^{--}_{(-n,m)} + x\Phi^{\overline{c}\zeta}_{(-n,m+1)}\big) + L_{x,y}\Lambda^{-\zeta}_{(-(n+1),m+1)}\Big] + x\Big[\Phi^{\overline{c}-}_{(-n,m+1)} + L_0\Lambda^{--}_{(-(n+1),m+1)}\Big]\\ &- x\,(Q - \overline{c}_0 L_0)\,\Lambda^{\overline{c}-}_{(-(n+1),m+1)} = 0\,.\end{aligned} \tag{C.16}$$

Thus if we set

$$\Lambda^{\overline{c}\zeta}_{(-(n+1),m+1)} = \Lambda^{\overline{c}-}_{(-(n+1),m+1)} = 0\,, \tag{C.17a}$$

$$\begin{aligned}\Lambda^{-\zeta}_{(-(n+1),m+1)} &= -\frac{1}{L_{x,y}}\big(y\widetilde{\Phi}^{--}_{(-n,m)} + x\Phi^{\overline{c}\zeta}_{(-n,m+1)}\big)\\ &= -\frac{1}{L_{x,y}}\big(y\overline{\eta}_0\zeta_0 b_0\overline{c}_0\widetilde{\Phi}_{(-n,m)} + x\overline{\eta}_0 b_0\Phi_{(-n,m+1)}\big),\end{aligned} \tag{C.17b}$$

$$\Lambda^{--}_{(-(n+1),m+1)} = -\frac{1}{L_0}\Phi^{\overline{c}-}_{(-n,m+1)} = -\frac{\overline{\eta}_0\zeta_0 b_0}{L_0}\Phi_{(-n,m+1)}\,, \tag{C.17c}$$

that is, if we set

$$\Lambda_{(-(n+1),m+1)} = -\frac{\overline{\eta}_0\zeta_0 b_0}{L_0}\Phi_{(-n,m+1)} - \frac{\zeta_0}{L_{x,y}}\big(yb_0\overline{c}_0\widetilde{\Phi}_{(-n,m)} + x\overline{\eta}_0 b_0\Phi_{(-n,m+1)}\big), \tag{C.18}$$

eq. (C.15) is indeed satisfied.

(II) $\mathbf{Eq}_{\boldsymbol{-(n+1),n}} \implies \exists\Lambda_{(-(n+1),n+1)}$, s.t. $\mathbf{Eq}_{\boldsymbol{-(n+1),n+1}}$ holds.

The proof of claim (II) is completed if we find $\Lambda_{(-(n+1),n+1)}$ such that

$$\zeta_0\big(\widetilde{\Phi}_{(-n,n)} + \eta_0\Lambda_{(-(n+1),n+1)}\big) = 0\,, \tag{C.19}$$

under conditions (C.12) and (C.13) with $m = n$. Putting eqs. (C.12) and (C.13) with $m = n$ into eq. (C.19) leads to

$$\zeta_0\big(\widetilde{\Phi}^{--}_{(-n,n)} + \overline{L}_0 \Lambda^{-\zeta}_{(-(n+1),n+1)}\big) = 0\,. \tag{C.20}$$

Thus the choice

$$\begin{aligned}
&\Lambda^{\overline{c}\zeta}_{(-(n+1),n+1)} = \Lambda^{\overline{c}-}_{(-(n+1),n+1)} = \Lambda^{--}_{(-(n+1),n+1)} = 0\,, \quad \Lambda^{-\zeta}_{(-(n+1),n+1)} = -\frac{1}{\overline{L}_0}\widetilde{\Phi}^{--}_{(-n,n)}\,, \quad \text{i.e.,}\\
&\Lambda_{(-(n+1),n+1)} = -\overline{\zeta}_0 b_0 \overline{c}_0 \widetilde{\Phi}_{(-n,n)}
\end{aligned} \tag{C.21}$$

solves eq. (C.19). ☐

Proposition 4.3 bis

(A) *For any string field* $\Phi_{(2,-1)}$ *of indicated quantum number, there exists a string field* $\Lambda_{(0,0)}$ *such that*

$$b_0\zeta_0\left(\Phi_{(2,-1)} + Q\eta_0\Lambda_{(0,0)}\right) = 0\,. \tag{4.24 bis}$$

(B) *Let* $n \geq 1$ *be fixed. For any set of string fields of the form* $\{\Phi_{(n+2,-m)} \mid 1 \leq m \leq n+1\}$, *there exists a set of string fields* $\{\Lambda_{(n+1,-m)} \mid 1 \leq m \leq n\}$ *such that*

$$\widetilde{\boldsymbol{B}}^{\boldsymbol{\zeta_0;x,y}}_{\boldsymbol{n+2,n+1}}\Big(\boldsymbol{\Phi_{n+2}} + \boldsymbol{Q_{n+1,n}\Lambda_{n+1}}\Big) = 0 \quad (n \geq 1)\,. \tag{4.25 bis}$$

Proof of (A). Eq. (4.24) is solved by

$$\Lambda_{(0,0)} = \frac{b_0\overline{\zeta}_0}{L_0}\Phi_{(2,-1)} \tag{C.22}$$

because we have

$$1 + Q\eta_0\left(\frac{b_0\overline{\zeta}_0}{L_0}\right) = 1 - \left(\frac{Qb_0}{L_0}\right)\eta_0\overline{\zeta}_0 = 1 - \left(1 - \frac{b_0Q}{L_0}\right)\left(1 - \overline{\zeta}_0\eta_0\right) = \frac{b_0Q}{L_0} + \overline{\zeta}_0\eta_0 - \frac{b_0Q}{L_0}\overline{\zeta}_0\eta_0\,. \tag{C.23}$$

Proof of (B). We prove the proposition case by case: the $x = 0$ case, the $y = 0$ case, and the x, $y \neq 0$ case. (Note the remark below eq. (3.7).)

(I) $\boldsymbol{x = 0}$ (and $\boldsymbol{y \neq 0}$) case

Eq. (4.25) is reduced to the following set of equations:

$$b_0\zeta_0\big(\Phi_{(n+2,-1)} + Q\Lambda_{(n+1,-1)}\big) = 0 \quad (n \geq 1)\,, \tag{C.24a}$$

$$\zeta_0\big(\widehat{\Phi}_{(n+2,-(m+1))} + \eta_0\Lambda_{(n+1,-m)}\big) = 0 \quad (1 \leq m \leq n)\,, \tag{C.24b}$$

with

$$\widehat{\Phi}_{(n+2,-(m+1))} := \begin{cases} \Phi_{(n+2,-(m+1))} + Q\Lambda_{(n+1,-(m+1))} & (1 \leq m \leq n-1)\,, \\ \Phi_{(n+2,-(n+1))} \quad (m = n)\,. \end{cases} \tag{C.25}$$

We can solve this by setting

$$\Lambda_{(n+1,-m)} = -\overline{\zeta}_0 \widehat{\Phi}_{(n+2,-(m+1))} \quad (2 \le m \le n)\,, \tag{C.26a}$$

$$\Lambda_{(n+1,-1)} = -\overline{\zeta}_0 \widehat{\Phi}_{(n+2,-2)} + \frac{b_0}{L_0}\eta_0 \overline{\zeta}_0\big(-\Phi_{(n+2,-1)} + \overline{X}_0 \widehat{\Phi}_{(n+2,-2)}\big) \quad (n \ge 1)\,, \tag{C.26b}$$

with

$$\overline{X}_0 := \{Q, \overline{\zeta}_0\} = \begin{cases} X_0 & \big(\text{for } \zeta_0 = \xi_0\big), \\ 0 & \big(\text{for } \zeta_0 = d_0\big). \end{cases} \tag{C.27}$$

(II) $y = 0$ (and $x \neq 0$) case

Eq. (4.25) is reduced to

$$b_0\big(\widehat{\Phi}_{(n+2,-m)} + Q\Lambda_{(n+1,-m)}\big) = 0 \quad (1 \le m \le n)\,, \tag{C.28a}$$

$$b_0\zeta_0\big(\Phi_{(n+2,-(n+1))} + \eta_0\Lambda_{(n+1,-n)}\big) = 0 \quad (n \ge 1)\,, \tag{C.28b}$$

with

$$\widehat{\Phi}_{(n+2,-m)} := \begin{cases} \Phi_{(n+2,-1)} & (m=1)\,, \\ \Phi_{(n+2,-m)} + \eta_0\Lambda_{(n+1,-(m-1))} & (2 \le m \le n)\,. \end{cases} \tag{C.29}$$

The above equations are solved by

$$\Lambda_{(n+1,-m)} = -\frac{b_0}{L_0}\widehat{\Phi}_{(n+2,-m)} \quad (1 \le m \le n)\,, \tag{C.30a}$$

$$\Lambda_{(n+1,-n)} = -\frac{b_0}{L_0}\widehat{\Phi}_{(n+2,-n)} - \frac{Qb_0}{L_0}\overline{\zeta}_0\Phi_{(n+2,-(n+1))} \quad (n \ge 1)\,. \tag{C.30b}$$

(III) $x \neq 0$, $y \neq 0$ case

According as $n = 1$ or $n \ge 2$, the set of constituent equations of (4.25) takes the different form: for $n = 1$, we have

$$x b_0\big(\Phi_{(3,-1)} + Q\Lambda_{(2,-1)}\big) + y\zeta_0\big(\Phi_{(3,-2)} + \eta_0\Lambda_{(2,-1)}\big) = 0\,, \tag{C.31}$$

whereas for $n \ge 2$, we have the three types of constituent equations

$$x b_0\big(\Phi_{(n+2,-1)} + Q\Lambda_{(n+1,-1)}\big) + y\zeta_0\big(\Phi_{(n+2,-2)} + \eta_0\Lambda_{(n+1,-1)} + Q\Lambda_{(n+1,-2)}\big) = 0 \quad (n \ge 2)\,, \tag{C.32a}$$

$$\begin{aligned} &x b_0\big(\Phi_{(n+2,-m)} + \eta_0\Lambda_{(n+1,-(m-1))} + Q\Lambda_{(n+1,-m)}\big) \\ &\quad + y\zeta_0\big(\Phi_{(n+2,-(m+1))} + \eta_0\Lambda_{(n+1,-m)} + Q\Lambda_{(n+1,-(m+1))}\big) = 0 \quad (2 \le m \le n-1)\,, \end{aligned} \tag{C.32b}$$

$$x b_0\big(\Phi_{(n+2,-n)} + \eta_0\Lambda_{(n+1,-(n-1))} + Q\Lambda_{(n+1,-n)}\big) + y\zeta_0\big(\Phi_{(n+2,-(n+1))} + \eta_0\Lambda_{(n+1,-n)}\big) = 0 \quad (n \ge 2)\,. \tag{C.32c}$$

However, we can prove the proposition by considering only a single set of equations: it is sufficient to show the existence of a solution to the set of equations below.

$$\mathbf{Eq}_{\boldsymbol{n+1,-n}}: \quad x b_0\big(\Phi_{(n+2,-n)} + Q\Lambda_{(n+1,-n)}\big) + y\zeta_0\big(\Phi_{(n+2,-(n+1))} + \eta_0\Lambda_{(n+1,-n)}\big) = 0 \quad (n \geq 1)\,, \tag{C.33a}$$

$$\mathbf{Eq}_{\boldsymbol{n+1,-m}}:$$

$$\begin{cases} b_0\eta_0\Lambda_{(n+1,-m)} = 0 \\ x b_0\big(\Phi_{(n+2,-m)} + Q\Lambda_{(n+1,-m)}\big) + y\zeta_0\Big(\big(\Phi_{(n+2,-(m+1))} + Q\Lambda_{(n+1,-(m+1))}\big) + \eta_0\Lambda_{(n+1,-m)}\Big) = 0 \end{cases}$$

$$(1 \leq m \leq n-1)\,. \tag{C.33b}$$

The following lemma completes the proof. □

Lemma C.2 *Let $n \geq 1$ be fixed, and let x and y be nonzero.*
(A) *There exists a solution $\Lambda_{(n+1,-n)}$ to the equation* $\mathbf{Eq}_{\boldsymbol{n+1,-n}}$.
(B) *If* $\mathbf{Eq}_{\boldsymbol{n+1,-(m+1)}}$ *holds for some m $(1 \leq \exists m \leq n-1)$, then there exists $\Lambda_{(n+1,-m)}$ which solves* $\mathbf{Eq}_{\boldsymbol{n+1,-m}}$.

Proof of (A). Using the zero-mode decomposition (C.10), we find that $\mathbf{Eq}_{\boldsymbol{n+1,-n}}$ is equivalent to

$$\begin{aligned} & y\overline{c}_0\zeta_0\Big[-\Phi^{\overline{c}-}_{(n+2,-(n+1))} + \overline{L}_0\Lambda^{\overline{c}\zeta}_{(n+1,-n)}\Big] \\ & + \zeta_0\Big[x\Phi^{\overline{c}\zeta}_{(n+2,-n)} + y\Phi^{--}_{(n+2,-(n+1))} + L_{x,y}\Lambda^{-\zeta}_{(n+1,-n)} + x\big(Q - \overline{c}_0L_0 - \eta_0\overline{X}_0\big)\Lambda^{\overline{c}\zeta}_{(n+1,-n)}\Big] \\ & + x\Big[\Phi^{\overline{c}-}_{(n+2,-n)} + L_0\Lambda^{--}_{(n+1,-n)} - \overline{L}_0\overline{X}_0\Lambda^{\overline{c}\zeta}_{(n+1,-n)} - \big(Q - \overline{c}_0L_0 - \eta_0\overline{X}_0\big)\Lambda^{\overline{c}-}_{(n+1,-n)}\Big] = 0\,. \end{aligned} \tag{C.34a}$$

Thus, if we set

$$\Lambda^{\overline{c}\zeta}_{(n+1,-n)} = \frac{1}{\overline{L}_0}\Phi^{\overline{c}-}_{(n+2,-(n+1))}\,, \tag{C.35a}$$

$$\Lambda^{\overline{c}-}_{(n+1,-n)} = 0\,, \tag{C.35b}$$

$$\Lambda^{-\zeta}_{(n+1,-n)} = -\frac{1}{L_{x,y}}\Big(x\Phi^{\overline{c}\zeta}_{(n+2,-n)} + y\Phi^{--}_{(n+2,-(n+1))} + x\big(Q - \overline{c}_0L_0 - \eta_0\overline{X}_0\big)\Lambda^{\overline{c}\zeta}_{(n+1,-n)}\Big)\,, \tag{C.35c}$$

$$\Lambda^{--}_{(n+1,-n)} = -\frac{1}{L_0}\big(\Phi^{\overline{c}-}_{(n+2,-n)} - \overline{L}_0\overline{X}_0\Lambda^{\overline{c}\zeta}_{(n+1,-n)}\big)\,, \tag{C.35d}$$

that is, if we set

$$\begin{aligned} \Lambda_{(n+1,-n)} = & -\overline{\zeta}_0\Phi_{(n+2,-(n+1))} + \frac{x\overline{\zeta}_0b_0}{L_{x,y}}\Big(\eta_0\Phi_{(n+2,-n)} + \big(Q - \eta_0\overline{X}_0\big)\Phi_{(n+2,-(n+1))}\Big) \\ & - \frac{\eta_0\overline{\zeta}_0b_0}{L_0}\big(\Phi_{(n+2,-n)} - \overline{X}_0\Phi_{(n+2,-(n+1))}\big)\,, \end{aligned} \tag{C.36}$$

the equation $\mathbf{Eq}_{\boldsymbol{n+1,-n}}$ is satisfied.

Proof of (B). The equations $\mathbf{Eq}_{\boldsymbol{n+1,-(m+1)}}$ and $b_0\eta_0\Lambda_{(n+1,-m)} = 0$ respectively imply

$$\widetilde{\Phi}^{\bar{c}-}_{(n+2,-(m+1))} = 0 \quad \text{(this follows from } \ \zeta_0 b_0 \widetilde{\Phi}_{(n+2,-(m+1))} = 0) \tag{C.37}$$

and

$$\Lambda^{\bar{c}\zeta}_{(n+1,-m)} = 0\,. \tag{C.38}$$

Here we have defined $\widetilde{\Phi}_{(n+2,-(m+1))}$ as

$$\widetilde{\Phi}_{(n+2,-(m+1))} := \Phi_{(n+2,-(m+1))} + Q\Lambda_{(n+1,-(m+1))}\,. \tag{C.39}$$

Therefore, for the purpose of proving the claim, it is sufficient to show the existence of $\Lambda_{(n+1,-m)}$ such that

$$x b_0\big(\Phi_{(n+2,-m)} + Q\Lambda_{(n+1,-m)}\big) + y\zeta_0\big(\widetilde{\Phi}_{(n+2,-(m+1))} + \eta_0\Lambda_{(n+1,-m)}\big) = 0\,, \tag{C.40}$$

under conditions (C.37) and (C.38). Because eqs. (C.37), (C.38), and (C.40) correspond to eqs. (C.12), (C.13), and (C.15), existence of such a $\Lambda_{(n+1,-m)}$ can be shown in the manner used when we proved claim (I) in the proof of lemma C.1. □

D Solutions to equations (4.22) and (4.33)

In the present appendix, we list the solutions to eqs. (4.22) and (4.33).

D.1 Solutions for the $\zeta_0 = \xi_0$ case

(I) The form of $\boldsymbol{P}$

Small-size matrices are given by

$$\boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\mathbf{1,1}} = \frac{\mathrm{i}}{L_0}\,, \quad \boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\mathbf{2,2}} = \begin{bmatrix} \frac{1}{L_0} & \frac{y\eta_0 b_0}{L_0 L_{x,y}} \\ -\frac{\xi_0 Q}{L_0}P_\xi & 1 \end{bmatrix}, \tag{D.1a}$$

$$\boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\mathbf{3,3}} = \left[\begin{array}{ccc} \frac{1}{L_0} & \frac{\eta_0 b_0}{L_0 L_{x,y}} & 0 \\ \frac{P_X}{L_0}P_\xi & \frac{1}{L_{x,y}} & 0 \\ \hline -\xi_0 Q\frac{P_X}{L_0} & -\xi_0 Q\frac{P_{Xb}}{L_{x,y}} & 1 \end{array}\right], \quad \boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\mathbf{4,4}} = \left[\begin{array}{cccc} \frac{1}{L_0} & \frac{\eta_0 b_0}{L_0 L_{x,y}} & 0 & 0 \\ \frac{P_X}{L_0}P_\xi & \frac{1}{L_{x,y}} & 0 & 0 \\ \hline \frac{P_X^2}{L_0} & \frac{P_X}{L_{x,y}}P_{Xb} & \frac{1}{L_{x,y}} & 0 \\ \hline -\xi_0 Q\frac{P_X^2}{L_0} & -\xi_0 Q\frac{P_X}{L_{x,y}}P_{Xb} & -\xi_0 Q\frac{1}{L_{x,y}} & 1 \end{array}\right], \tag{D.1b}$$

$$
\boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{5,5}} = \left[\begin{array}{ccccc}
\frac{1}{L_0} & \frac{\eta_0 b_0}{L_0 L_{x,y}} & 0 & 0 & 0 \\
\frac{P_X}{L_0}P_\xi & \frac{1}{L_{x,y}} & 0 & 0 & 0 \\
\hline
\frac{P_X^2}{L_0} & \frac{P_X}{L_{x,y}}P_{Xb} & \frac{1}{L_{x,y}} & 0 & 0 \\
\frac{P_X^3}{L_0} & \frac{P_X^2}{L_{x,y}}P_{Xb} & \frac{P_X}{L_{x,y}} & \frac{1}{L_{x,y}} & 0 \\
\hline
-\xi_0 Q\frac{P_X^3}{L_0} & -\xi_0 Q\frac{P_X^2}{L_{x,y}}P_{Xb} & -\xi_0 Q\frac{P_X}{L_{x,y}} & -\xi_0 Q\frac{1}{L_{x,y}} & 1
\end{array}\right], \tag{D.1c}
$$

with

$$
P_X := -\frac{yX_0}{L_{x,y}}, \quad P_\xi := 1 - y\frac{\eta_0\xi_0}{L_{x,y}}, \quad P_{Xb} := 1 + P_X\frac{\eta_0 b_0}{L_0} = 1 - y\frac{X_0\eta_0 b_0}{L_0 L_{x,y}}. \tag{D.2}
$$

The symbol X_0 denotes $\{Q, \xi_0\}$, which is precisely the zero mode of the picture-changing operator $X(z) = \{Q, \xi(z)\}$. For an arbitrary $n\,(\geq 1)$, we have

$$
\boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n+2,n+2}} \;(n \geq 1)
$$

$$
= \left[\begin{array}{ccccccccc}
\frac{1}{L_0} & \frac{\eta_0 b_0}{L_0 L_{x,y}} & 0 & 0 & 0 & \cdots & 0 & 0 & 0 \\
\frac{P_X}{L_0}P_\xi & \frac{1}{L_{x,y}} & 0 & 0 & 0 & \cdots & 0 & 0 & 0 \\
\hline
\frac{P_X^2}{L_0} & \frac{P_X}{L_{x,y}}P_{Xb} & \frac{1}{L_{x,y}} & 0 & 0 & \cdots & 0 & 0 & 0 \\
\frac{P_X^3}{L_0} & \frac{P_X^2}{L_{x,y}}P_{Xb} & \frac{P_X}{L_{x,y}} & \frac{1}{L_{x,y}} & 0 & \cdots & 0 & 0 & 0 \\
\frac{P_X^4}{L_0} & \frac{P_X^3}{L_{x,y}}P_{Xb} & \frac{P_X^2}{L_{x,y}} & \frac{P_X}{L_{x,y}} & \frac{1}{L_{x,y}} & \cdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \cdots & \vdots & \vdots & \vdots \\
\vdots & \vdots & \vdots & \vdots & \vdots & \cdots & 0 & 0 & 0 \\
\frac{P_X^{n-1}}{L_0} & \frac{P_X^{n-2}}{L_{x,y}}P_{Xb} & \frac{P_X^{n-3}}{L_{x,y}} & \frac{P_X^{n-4}}{L_{x,y}} & \frac{P_X^{n-5}}{L_{x,y}} & \cdots & \frac{1}{L_{x,y}} & 0 & 0 \\
\frac{P_X^{n}}{L_0} & \frac{P_X^{n-1}}{L_{x,y}}P_{Xb} & \frac{P_X^{n-2}}{L_{x,y}} & \frac{P_X^{n-3}}{L_{x,y}} & \frac{P_X^{n-4}}{L_{x,y}} & \cdots & \frac{P_X}{L_{x,y}} & \frac{1}{L_{x,y}} & 0 \\
\hline
-\xi_0 Q\frac{P_X^{n}}{L_0} & -\xi_0 Q\frac{P_X^{n-1}}{L_{x,y}}P_{Xb} & -\xi_0 Q\frac{P_X^{n-2}}{L_{x,y}} & -\xi_0 Q\frac{P_X^{n-3}}{L_{x,y}} & -\xi_0 Q\frac{P_X^{n-4}}{L_{x,y}} & \cdots & -\xi_0 Q\frac{P_X}{L_{x,y}} & -\frac{\xi_0 Q}{L_{x,y}} & 1
\end{array}\right]. \tag{D.3}
$$

To avoid confusion, we write down the (i, j)-components $p^{\xi_0;i,j}_{n+2}$ of $\boldsymbol{P}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n+2,n+2}}$ $(n \geq 1)$ below:

$$
p^{\xi_0;1,1}_{n+2} = \frac{1}{L_0}, \quad p^{\xi_0;1,2}_{n+2} = \frac{\eta_0 b_0}{L_0 L_{x,y}}, \quad p^{\xi_0;1,j}_{n+2} = 0 \quad (3 \leq j \leq n+2), \tag{D.4a}
$$

$$
p^{\xi_0;2,1}_{n+2} = \frac{P_X}{L_0}P_\xi, \quad p^{\xi_0;2,2}_{n+2} = \frac{1}{L_{x,y}}, \quad p^{\xi_0;2,j}_{n+2} = 0 \quad (3 \leq j \leq n+2), \tag{D.4b}
$$

$$
p^{\xi_0;i,1}_{n+2} = \frac{P_X^{i-1}}{L_0}, \quad p^{\xi_0;i,2}_{n+2} = \frac{P_X^{i-2}}{L_{x,y}}P_{Xb}, \quad p^{\xi_0;i,j}_{n+2} = \frac{P_X^{i-j}}{L_{x,y}}, \quad p^{\xi_0;i,k}_{n+2} = 0 \quad (3 \leq j \leq i < k \leq n+2), \tag{D.4c}
$$

$$\begin{cases} p_{n+2}^{\xi_0;n+2,1} = -\xi_0 Q \dfrac{P_X^n}{L_0}\,, \quad p_{n+2}^{\xi_0;n+2,2} = -\xi_0 Q \dfrac{P_X^{n-1}}{L_{x,y}} P_{Xb} \quad (n \geq 1)\,, \\ p_{n+2}^{\xi_0;n+2,j} = -\xi_0 Q \dfrac{P_X^{n+1-j}}{L_{x,y}} \quad (3 \leq j \leq n+1)\,, \\ p_{n+2}^{\xi_0;n+2,n+2} = 1 \quad (n \geq 1)\,. \end{cases} \tag{D.4d}$$

(II) The form of M

$$\boldsymbol{M}_{\boldsymbol{1,2}}^{\boldsymbol{\xi_0;x,y}} = \begin{bmatrix} -\xi_0\eta_0\frac{Q}{L_0} & -\eta_0 \end{bmatrix}, \tag{D.5a}$$

$$\boldsymbol{M}_{\boldsymbol{2,3}}^{\boldsymbol{\xi_0;x,y}} = \left[\begin{array}{ccc} -P_\xi\frac{Q}{L_0} & -\frac{\eta_0}{L_{x,y}} & 0 \\ \hline \xi_0 Q P_\xi \frac{Q}{L_0} & \xi_0 Q\frac{\eta_0}{L_{x,y}} & -\eta_0 \end{array}\right], \quad \boldsymbol{M}_{\boldsymbol{3,4}}^{\boldsymbol{\xi_0;x,y}} = \left[\begin{array}{cccc} -P_\xi\frac{Q}{L_0} & -\frac{\eta_0}{L_{x,y}} & 0 & 0 \\ -P_X P_\xi\frac{Q}{L_0} & -\frac{M_Q}{L_{x,y}} & -\frac{\eta_0}{L_{x,y}} & 0 \\ \hline \xi_0 Q P_X P_\xi\frac{Q}{L_0} & \xi_0 Q\frac{M_Q}{L_{x,y}} & \xi_0 Q\frac{\eta_0}{L_{x,y}} & -\eta_0 \end{array}\right], \tag{D.5b}$$

$$\boldsymbol{M}_{\boldsymbol{n+2,n+3}}^{\boldsymbol{\xi_0;x,y}} \ (n \geq 0)$$

$$= \left[\begin{array}{cccccccc} -P_\xi\frac{Q}{L_0} & -\frac{\eta_0}{L_{x,y}} & 0 & 0 & \cdots & 0 & 0 & 0 \\ -P_X P_\xi\frac{Q}{L_0} & -\frac{M_Q}{L_{x,y}} & -\frac{\eta_0}{L_{x,y}} & 0 & \cdots & 0 & 0 & 0 \\ -P_X^2 P_\xi\frac{Q}{L_0} & -P_X\frac{M_Q}{L_{x,y}} & -\frac{M_Q}{L_{x,y}} & -\frac{\eta_0}{L_{x,y}} & \cdots & 0 & 0 & 0 \\ \vdots & \vdots & \vdots & \vdots & \cdots & \vdots & \vdots & \vdots \\ \vdots & \vdots & \vdots & \vdots & \cdots & 0 & 0 & 0 \\ -P_X^{n-1} P_\xi\frac{Q}{L_0} & -P_X^{n-2}\frac{M_Q}{L_{x,y}} & -P_X^{n-3}\frac{M_Q}{L_{x,y}} & -P_X^{n-4}\frac{M_Q}{L_{x,y}} & \cdots & -\frac{\eta_0}{L_{x,y}} & 0 & 0 \\ -P_X^{n} P_\xi\frac{Q}{L_0} & -P_X^{n-1}\frac{M_Q}{L_{x,y}} & -P_X^{n-2}\frac{M_Q}{L_{x,y}} & -P_X^{n-3}\frac{M_Q}{L_{x,y}} & \cdots & -\frac{M_Q}{L_{x,y}} & -\frac{\eta_0}{L_{x,y}} & 0 \\ \hline \xi_0 Q P_X^n P_\xi\frac{Q}{L_0} & \xi_0 Q P_X^{n-1}\frac{M_Q}{L_{x,y}} & \xi_0 Q P_X^{n-2}\frac{M_Q}{L_{x,y}} & \xi_0 Q P_X^{n-3}\frac{M_Q}{L_{x,y}} & \cdots & \xi_0 Q\frac{M_Q}{L_{x,y}} & \xi_0 Q\frac{\eta_0}{L_{x,y}} & -\eta_0 \end{array}\right], \tag{D.6}$$

with

$$M_Q := Q + P_X\eta_0 = Q - y\frac{X_0\eta_0}{L_{x,y}}\,. \tag{D.7}$$

The operators P_X and P_ξ are defined in eq. (D.2). The (i,j)-components $m^{\xi_0;i,j}_{n+2,n+3}$ of $\boldsymbol{M}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n+2,n+3}}$ $(n \geq 0)$ are given by

$$\begin{cases} m^{\xi_0;i,1}_{n+2,n+3} = -P_X^{i-1} P_\xi \dfrac{Q}{L_0} \quad (1 \leq i \leq n+1)\,, \\ m^{\xi_0;i,j}_{n+2,n+3} = -P_X^{i-j} \dfrac{M_Q}{L_{x,y}} \quad (2 \leq j \leq i \leq n+1)\,, \\ m^{\xi_0;i,i+1}_{n+2,n+3} = -\dfrac{\eta_0}{L_{x,y}}\,, \quad m^{\xi_0;i,j}_{n+2,n+3} = 0 \quad (1 \leq i \leq j-2 \leq n+1)\,, \end{cases} \tag{D.8a}$$

$$\begin{cases} m^{\xi_0;n+2,j}_{n+2,n+3} = -\xi_0 Q \, m^{\xi_0;n+1,j}_{n+2,n+3} \quad (1 \leq j \leq n+2)\,, \\ m^{\xi_0;n+2,n+3}_{n+2,n+3} = -\eta_0 \quad (n \geq 0)\,. \end{cases} \tag{D.8b}$$

(III) The form of $\boldsymbol{\widetilde{P}}$

$$\boldsymbol{\widetilde{P}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{1,3}} = \begin{bmatrix} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}}\widetilde{P}_b & \frac{xQ}{L_{x,y}} \end{bmatrix}, \quad \boldsymbol{\widetilde{P}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{2,4}} = \left[\begin{array}{cccc} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} P^\star_{Xb} & \frac{P_X}{L_{x,y}} \widetilde{P}_b & x\frac{P_X}{L_{x,y}} Q \\ \hline 0 & 0 & \frac{1}{L_{x,y}} & \frac{xQ}{L_{x,y}} \end{array}\right], \tag{D.9a}$$

$$\boldsymbol{\widetilde{P}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{3,5}} = \left[\begin{array}{ccccc} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} P^\star_{Xb} & \frac{P_X}{L_{x,y}} P^\star_{Xb} & \frac{P_X^2}{L_{x,y}} \widetilde{P}_b & x\frac{P_X^2}{L_{x,y}} Q \\ \hline 0 & 0 & \frac{1}{L_{x,y}} & \frac{P_X}{L_{x,y}} & x\frac{P_X}{L_{x,y}} Q \\ 0 & 0 & 0 & \frac{1}{L_{x,y}} & \frac{xQ}{L_{x,y}} \end{array}\right], \tag{D.9b}$$

$\boldsymbol{\widetilde{P}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n,n+2}}$ $(n \geq 1)$

$$= \left[\begin{array}{cccccccccc} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} P^\star_{Xb} & \frac{P_X}{L_{x,y}} P^\star_{Xb} & \frac{P_X^2}{L_{x,y}} P^\star_{Xb} & \frac{P_X^3}{L_{x,y}} P^\star_{Xb} & \cdots & \frac{P_X^{n-3}}{L_{x,y}} P^\star_{Xb} & \frac{P_X^{n-2}}{L_{x,y}} P^\star_{Xb} & \frac{P_X^{n-1}}{L_{x,y}} \widetilde{P}_b & x\frac{P_X^{n-1}}{L_{x,y}} Q \\ \hline 0 & 0 & \frac{1}{L_{x,y}} & \frac{P_X}{L_{x,y}} & \frac{P_X^2}{L_{x,y}} & \cdots & \frac{P_X^{n-4}}{L_{x,y}} & \frac{P_X^{n-3}}{L_{x,y}} & \frac{P_X^{n-2}}{L_{x,y}} & x\frac{P_X^{n-2}}{L_{x,y}} Q \\ 0 & 0 & 0 & \frac{1}{L_{x,y}} & \frac{P_X}{L_{x,y}} & \cdots & \frac{P_X^{n-5}}{L_{x,y}} & \frac{P_X^{n-4}}{L_{x,y}} & \frac{P_X^{n-3}}{L_{x,y}} & x\frac{P_X^{n-3}}{L_{x,y}} Q \\ 0 & 0 & 0 & 0 & \frac{1}{L_{x,y}} & \cdots & \frac{P_X^{n-6}}{L_{x,y}} & \frac{P_X^{n-5}}{L_{x,y}} & \frac{P_X^{n-4}}{L_{x,y}} & x\frac{P_X^{n-4}}{L_{x,y}} Q \\ \vdots & \vdots & \vdots & \vdots & \vdots & \cdots & \vdots & \vdots & \vdots & \vdots \\ 0 & 0 & 0 & 0 & 0 & \cdots & 0 & \frac{1}{L_{x,y}} & \frac{P_X}{L_{x,y}} & x\frac{P_X}{L_{x,y}} Q \\ 0 & 0 & 0 & 0 & 0 & \cdots & 0 & 0 & \frac{1}{L_{x,y}} & x\frac{1}{L_{x,y}} Q \end{array}\right]. \tag{D.10}$$

Here we have denoted the BPZ conjugation by $\star$ and have defined $\widetilde{P}_b$ as

$$\widetilde{P}_b := 1 + \frac{X_0 \eta_0 b_0}{L_0}\,. \tag{D.11}$$

For the operators P_X and P_{Xb}, see eq. (D.2). The (i,j)-components $\widetilde{p}^{\,\xi_0;i,j}_{n,n+2}$ of $\widetilde{\boldsymbol{P}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n,n+2}}$ $(n \geq 1)$ are given by

$$\begin{cases} \widetilde{p}^{\,\xi_0;1,1}_{n,n+2} = -\dfrac{y\eta_0}{L_0 L_{x,y}}\,, \quad \widetilde{p}^{\,\xi_0;1,j}_{n,n+2} = \dfrac{P_X^{j-2}}{L_{x,y}} P^\star_{Xb} \quad (2 \leq j \leq n)\,, \\ \widetilde{p}^{\,\xi_0;1,n+1}_{n,n+2} = \dfrac{P_X^{n-1}}{L_{x,y}} \widetilde{P}_b\,, \quad \widetilde{p}^{\,\xi_0;1,n+2}_{n,n+2} = x\dfrac{P_X^{n-1}}{L_{x,y}} Q \quad (n \geq 1)\,, \end{cases} \tag{D.12a}$$

$$\begin{cases} \widetilde{p}^{\,\xi_0;i,j}_{n,n+2} = 0 \quad (1 \leq j \leq i,\ 2 \leq i \leq n)\,, \\ \widetilde{p}^{\,\xi_0;i,j}_{n,n+2} = \dfrac{P_X^{j-i-1}}{L_{x,y}}\,, \quad \widetilde{p}^{\,\xi_0;i,n+2}_{n,n+2} = x\dfrac{P_X^{n-i}}{L_{x,y}} Q \quad (2 \leq i < j \leq n+1)\,. \end{cases} \tag{D.12b}$$

(IV) The form of $\widetilde{M}$

$$\widetilde{\boldsymbol{M}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{1,2}} = \left[\begin{array}{cc} \frac{yQ\eta_0}{L_0 L_{x,y}} & \frac{xQ\eta_0}{L_0 L_{x,y}} \end{array}\right], \tag{D.13a}$$

$$\widetilde{\boldsymbol{M}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{2,3}} = \left[\begin{array}{ccc} \frac{yQ\eta_0}{L_0 L_{x,y}} & -\frac{Q}{L_{x,y}}\widetilde{P}_b & 0 \\ \hline 0 & -\frac{\eta_0}{L_{x,y}} & \frac{xQ\eta_0}{L_{x,y}} \end{array}\right], \quad \widetilde{\boldsymbol{M}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{3,4}} = \left[\begin{array}{cccc} \frac{yQ\eta_0}{L_0 L_{x,y}} & -\frac{Q}{L_{x,y}}P^\star_{Xb} & -\frac{QP_X}{L_{x,y}}\widetilde{P}_b & 0 \\ \hline 0 & -\frac{\eta_0}{L_{x,y}} & -\frac{1}{L_{x,y}}M_Q & x\frac{P_X}{L_{x,y}}Q\eta_0 \\ 0 & 0 & -\frac{\eta_0}{L_{x,y}} & \frac{xQ\eta_0}{L_{x,y}} \end{array}\right], \tag{D.13b}$$

$$\widetilde{\boldsymbol{M}}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n,n+1}} \ (n \geq 2)$$

D.2 Solutions for the $\zeta_0 = d_0$ case

(I) The form of $\boldsymbol{P}$

Small-size matrices are given by

$$\boldsymbol{P}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{1,1}} = \frac{\mathrm{i}}{L_0^2}\,, \quad \boldsymbol{P}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{2,2}} = \begin{bmatrix} \frac{1}{L_0} & yP_b \\ xP_d & \frac{1}{L_0} \end{bmatrix}, \tag{D.16a}$$

$$\boldsymbol{P}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{3,3}} = \begin{bmatrix} \frac{1}{L_0} & P_b & 0 \\ 0 & \frac{1}{L_{x,y}} & 0 \\ 0 & P_d & \frac{1}{L_0} \end{bmatrix}, \quad \boldsymbol{P}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{4,4}} = \begin{bmatrix} \frac{1}{L_0} & P_b & 0 & 0 \\ 0 & \frac{1}{L_{x,y}} & 0 & 0 \\ 0 & 0 & \frac{1}{L_{x,y}} & 0 \\ 0 & 0 & P_d & \frac{1}{L_0} \end{bmatrix}, \tag{D.16b}$$

with

$$P_b := \frac{\eta_0 b_0}{L_0 L_{x,y}}\,, \quad P_d := \frac{Q d_0}{L_0 L_{x,y}}\,. \tag{D.17}$$

For an arbitrary $n\,(\geq 1)$, we have

$$\boldsymbol{P}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{n+2,n+2}} = \begin{bmatrix} \frac{1}{L_0} & P_b & & & & & \Huge 0 \\ & \frac{1}{L_{x,y}} & & & & & \\ & & \frac{1}{L_{x,y}} & & & & \\ & & & \ddots & & & \\ & & & & \frac{1}{L_{x,y}} & & \\ & & & & & \frac{1}{L_{x,y}} & \\ \Huge 0 & & & & & P_d & \frac{1}{L_0} \end{bmatrix} \quad (n \geq 1)\,. \tag{D.18}$$

(II) The form of M

$$\boldsymbol{M}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{1,2}} = \begin{bmatrix} M_d & M_b \end{bmatrix}, \quad \boldsymbol{M}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{2,3}} = \begin{bmatrix} M_d & -\frac{\eta_0}{L_{x,y}} & 0 \\ 0 & -\frac{Q}{L_{x,y}} & M_b \end{bmatrix}, \tag{D.19}$$

$$\boldsymbol{M}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{n+2,n+3}} = \begin{bmatrix} M_d & -\frac{\eta_0}{L_{x,y}} & & & \Huge 0 \\ & -\frac{Q}{L_{x,y}} & \ddots & & \\ & & \ddots & -\frac{\eta_0}{L_{x,y}} & \\ \Huge 0 & & & -\frac{Q}{L_{x,y}} & M_b \end{bmatrix} \quad (n \geq 0)\,, \tag{D.20}$$

with

$$M_d := -\left(1 - y\frac{\eta_0 d_0}{L_{x,y}}\right)\frac{Q}{L_0}\,, \quad M_b := -\left(1 - x\frac{Q b_0}{L_{x,y}}\right)\frac{\eta_0}{L_0}\,. \tag{D.21}$$

(III) The form of $\widetilde{P}$

$$\widetilde{\boldsymbol{P}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{1,3}} = \begin{bmatrix} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} & \frac{xQ}{L_0 L_{x,y}} \end{bmatrix}, \quad \widetilde{\boldsymbol{P}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{2,4}} = \begin{bmatrix} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} & 0 & 0 \\ 0 & 0 & \frac{1}{L_{x,y}} & \frac{xQ}{L_0 L_{x,y}} \end{bmatrix}, \tag{D.22}$$

$$\widetilde{\boldsymbol{P}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{n,n+2}} = \begin{bmatrix} -\frac{y\eta_0}{L_0 L_{x,y}} & \frac{1}{L_{x,y}} & & & & \Huge 0 \\ & & \frac{1}{L_{x,y}} & & & \\ & & & \ddots & & \\ & & & & \frac{1}{L_{x,y}} & \\ \Huge 0 & & & & & \frac{1}{L_{x,y}} \quad \frac{xQ}{L_0 L_{x,y}} \end{bmatrix} \quad (n \geq 1)\,. \tag{D.23}$$

(IV) The form of $\widetilde{M}$

$$\widetilde{\boldsymbol{M}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{1,2}} = \begin{bmatrix} \frac{yQ\eta_0}{L_0 L_{x,y}} & \frac{xQ\eta_0}{L_0 L_{x,y}} \end{bmatrix}, \quad \widetilde{\boldsymbol{M}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{2,3}} = \begin{bmatrix} \frac{yQ\eta_0}{L_0 L_{x,y}} & -\frac{Q}{L_{x,y}} & 0 \\ 0 & -\frac{\eta_0}{L_{x,y}} & \frac{xQ\eta_0}{L_0 L_{x,y}} \end{bmatrix}, \tag{D.24}$$

$$\widetilde{\boldsymbol{M}}^{\boldsymbol{d_0;x,y}}_{\boldsymbol{n,n+1}} = \left[\begin{array}{cccccc} \frac{yQ\eta_0}{L_0L_{x,y}} & -\frac{Q}{L_{x,y}} & & & & \text{\Large 0} \\ & -\frac{\eta_0}{L_{x,y}} & -\frac{Q}{L_{x,y}} & & & \\ & & -\frac{\eta_0}{L_{x,y}} & \ddots & & \\ & & & \ddots & -\frac{Q}{L_{x,y}} & \\ \text{\Large 0} & & & & -\frac{\eta_0}{L_{x,y}} & \frac{xQ\eta_0}{L_0L_{x,y}} \end{array}\right] \quad (n \geq 1)\,. \tag{D.25}$$

E Concrete forms of $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$

After listing some small-size matrices, we give $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$ for general n. Moreover, we specify the components of the matrices when ζ_0 is equal to ξ_0.

E.1 $\boldsymbol{K}$ and $\widetilde{\boldsymbol{K}}$ for the $\zeta_0 = \xi_0$ case

(I) The form of $\boldsymbol{K}$

$$\boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{1,0}} = \mathrm{i}\,\frac{b_0\xi_0}{L_0}\,, \qquad \boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{2,1}} = \left[\begin{array}{c} \frac{P_\xi b_0}{L_0} \\ -\xi_0 Q\frac{P_\xi b_0}{L_0} + \xi_0 \end{array}\right], \tag{E.1a}$$

$$\boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{3,2}} = \left[\begin{array}{cc} \frac{P_\xi b_0}{L_0} & 0 \\ \frac{P_X P_\xi b_0}{L_0} + \frac{y\xi_0}{L_{x,y}} & \frac{xb_0}{L_{x,y}} \\ \hline -\xi_0 QK_{Xb} & \xi_0\big(1 - \frac{xQb_0}{L_{x,y}}\big) \end{array}\right], \quad \boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{4,3}} = \left[\begin{array}{ccc} \frac{P_\xi b_0}{L_0} & 0 & 0 \\ \frac{P_X P_\xi b_0}{L_0} + \frac{y\xi_0}{L_{x,y}} & \frac{xb_0}{L_{x,y}} & 0 \\ \hline P_X K_{Xb} & \frac{1}{L_{x,y}}K_\xi & \frac{xb_0}{L_{x,y}} \\ \hline -\xi_0 QP_X K_{Xb} & -\frac{\xi_0 Q}{L_{x,y}}K_\xi & \xi_0\big(1 - \frac{xQb_0}{L_{x,y}}\big) \end{array}\right], \tag{E.1b}$$

$$\boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{5,4}} = \left[\begin{array}{cccc} \frac{P_\xi b_0}{L_0} & 0 & 0 & 0 \\ \frac{P_X P_\xi b_0}{L_0} + \frac{y\xi_0}{L_{x,y}} & \frac{xb_0}{L_{x,y}} & 0 & 0 \\ \hline P_X K_{Xb} & \frac{1}{L_{x,y}}K_\xi & \frac{xb_0}{L_{x,y}} & 0 \\ P_X^2 K_{Xb} & \frac{P_X}{L_{x,y}}K_\xi & \frac{1}{L_{x,y}}K_\xi & \frac{xb_0}{L_{x,y}} \\ \hline -\xi_0 QP_X^2 K_{Xb} & -\xi_0 Q\frac{P_X}{L_{x,y}}K_\xi & -\frac{\xi_0 Q}{L_{x,y}}K_\xi & \xi_0\big(1 - \frac{xQb_0}{L_{x,y}}\big) \end{array}\right], \tag{E.1c}$$

$\boldsymbol{K}^{\boldsymbol{\xi_0;x,y}}_{\boldsymbol{n+1,n}}$ $(n \geq 3)$

$$

(II) The form of $\widetilde{\boldsymbol{K}}$

$$\widetilde{\boldsymbol{K}}_{\mathbf{0,1}}^{\boldsymbol{d_0;x,y}} := \mathrm{bpz}\Big(\boldsymbol{K}_{\mathbf{1,0}}^{\boldsymbol{d_0;x,y}}\Big) = \mathrm{i}\,\frac{b_0 d_0}{L_0^2}\,, \quad \widetilde{\boldsymbol{K}}_{\mathbf{1,2}}^{\boldsymbol{d_0;x,y}} = \begin{bmatrix} \widetilde{K}_b & \widetilde{K}_d \end{bmatrix}, \quad \widetilde{\boldsymbol{K}}_{\mathbf{2,3}}^{\boldsymbol{d_0;x,y}} = \begin{bmatrix} \widetilde{K}_b & \frac{yd_0}{L_{x,y}} & 0 \\ 0 & \frac{xb_0}{L_{x,y}} & \widetilde{K}_d \end{bmatrix}, \tag{E.12}$$

$$\widetilde{\boldsymbol{K}}_{\boldsymbol{n,n+1}}^{\boldsymbol{d_0;x,y}} = \begin{bmatrix} \widetilde{K}_b & \frac{yd_0}{L_{x,y}} & & & & 0 \\ & \frac{xb_0}{L_{x,y}} & \frac{yd_0}{L_{x,y}} & & & \\ & & \frac{xb_0}{L_{x,y}} & \ddots & & \\ & & & \ddots & \frac{yd_0}{L_{x,y}} & \\ 0 & & & & \frac{xb_0}{L_{x,y}} & \widetilde{K}_d \end{bmatrix} \quad (n \geq 1)\,, \tag{E.13}$$

with

$$\widetilde{K}_b := \Big(x + y\frac{\eta_0 d_0}{L_0}\Big)\frac{b_0}{L_{x,y}}\,, \quad \widetilde{K}_d := \Big(y + x\frac{Q b_0}{L_0}\Big)\frac{d_0}{L_{x,y}}\,. \tag{E.14}$$
